
Natural Dualities for the Working Algebraist

David M. Clark and Brian A. Davey

 **CAMBRIDGE**
UNIVERSITY PRESS

Contents

Preface	ix
1. Dual Equivalences and Where to Find Them	1
1. Categories	2
2. Distributive lattices	7
3. Quasi-varieties	15
4. Structured topological spaces	20
5. Predualities	29
2. Natural Dualities	39
1. Brute force	39
2. Duality theorems	41
3. Taming brute force with near-unanimity	52
4. Refining duality via entailment	55
3. Strong Dualities	62
1. Full duality and the dual category	63
2. Strong duality and the role of injectivity	71
3. Producing strong dualities	79
4. Examples of Strong Dualities	94
1. Strong dualities from primality and its variants	94
2. Arithmetical strong dualities	98
3. NU strong dualities	102
4. Two-for-one strong dualities	113
5. Vagrant dualities	116
5. Sample Applications	124
1. Compactness of propositional logic	124
2. Endomorphism monoids and upside down lattices	125
3. Theory of algebraic and existential closure	129
4. Examples of algebraic and existential closure	135
5. Injectives, weak injectives and absolute subretracts	144
6. Category equivalences	159
6. What Makes a Duality Useful?	171
1. Total structures and injectivity	173
2. Unary structures, coproducts and near-unanimity	177
3. Better coproducts and logarithmicity	182
4. Exclusively unary structures and arithmeticity	186

7. Piggyback Dualities	192
1. Multisorted dualities	192
2. Piggyback dualities for distributive-lattice-based algebras	195
3. Piggyback dualities for varieties of Heyting algebras	199
4. Restricted Priestley dualities	202
5. Piggyback dualities for varieties of Ockham algebras	207
6. Piggyback dualities for varieties of distributive p -algebras	216
7. Completely dualisable quasi-varieties	221
8. Endodualisable algebras	225
8. Optimal Dualities and Entailment	233
1. Test algebras—schizophrenia strikes again!	234
2. Entailment closure and the ‘topology’ of failsets	238
3. Failsets and optimal dualities	240
4. Kleene algebras once again	246
5. The structure of failsets	251
6. Optimal dualities for varieties of distributive p -algebras	261
9. Completeness Theorems for Entailment	270
1. The syntax of entailment	270
2. Completeness of constructs for entailment	274
3. Local entailment	278
4. Optimal strong dualities and hom-entailment	281
5. An example: the three-element chain	286
10. Dualisable Algebras	291
1. Dualisability	291
2. Near-unanimity as an obstacle to duality	292
3. Some applications of the NU obstacle theorems	296
4. The balanced subalgebra method	299
5. The ghost element method	304
6. The term-closed subset method	309
7. Dualisable clones on a two-element set	317
Appendix A: Algebras	325
Appendix B: Boolean Spaces	337
Bibliography	341
Notation	348
Index	350
