

# Building Intelligent Middleware for Large Scale M2M Systems

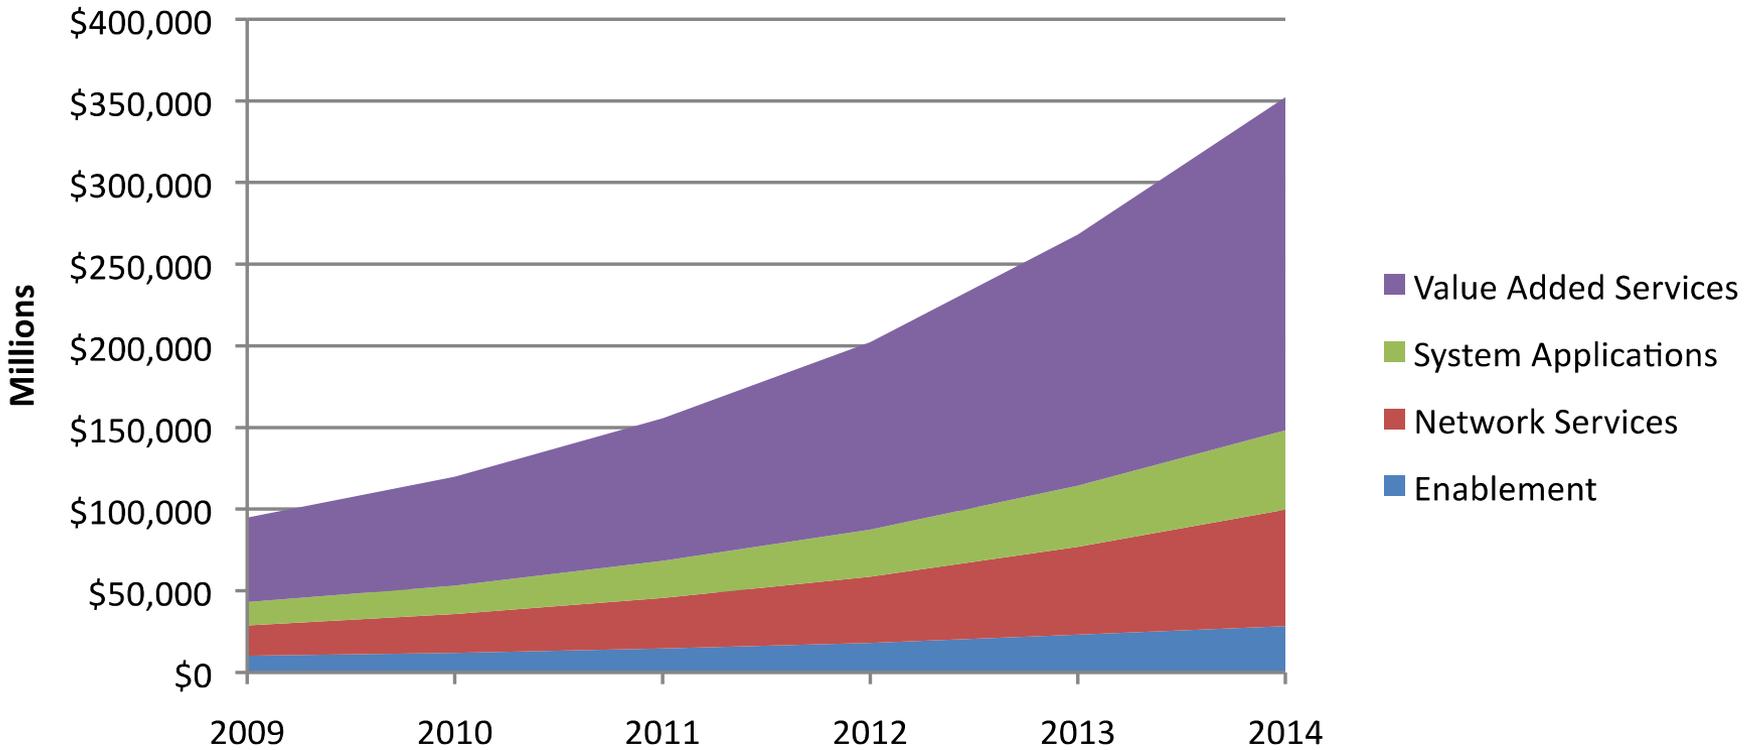

Kwei-Jay Lin\*, Chi-Sheng Shih, Yu-Chung Wang, Jane Y. Hsu  
*National Taiwan University, \* University of California, Irvine*

# M2M Future (by Harbor Research, Inc.)

- M2M future is on many new services to be deployed
- These services must be easy to develop, to deliver and to defend
- We need a powerful and intelligent platform to support future M2M

Source: Harbor Research

- “The next chapter in the M2M arena will be driven by cloud platforms, intelligent devices and back office systems that [seamlessly integrate with one another](#) and thereby unlock the full potential of smart connected devices.
- **Uninformed human activity in customer support will be replaced by embedded intelligence in devices and smart systems.**
- The complexities of disparate networks, devices and hardware will be removed thus [reducing time to market and overall costs and risks for custom application development](#). All of this will be done with enterprise solutions engineered for deployment on the world’s leading wireless networks.”

“Next Generation Platform Innovation In M2M”, whitepaper, Harbor Research, Inc. March 2011  
[<http://www.harborresearch.com/HarborContent/whitepapers.html>]

- “Having nearly reached the saturation point with traditional enterprise application development and deployment, professional IT services firms are now turning their attention to non-IT devices capable of being connected to a network and integrated into cloud services.”
- While the IoT (Internet of Things) is a huge opportunity with many new market entrants who are predicting that enormous volumes of connected devices are “just around the corner”, ... **the biggest challenge will be finding enough new technology and industry fluent players to develop all the applications** required to inform this expanding opportunity. “

“Who's Developing All The Applications For 50 Billion Devices?”, *Harbor Research, Inc.*

[[http://harborresearch.com/\\_blog/Smart\\_Business\\_Blog/post/Who's\\_Developing\\_All\\_The\\_Applications\\_For\\_50\\_Billion\\_Devices/](http://harborresearch.com/_blog/Smart_Business_Blog/post/Who's_Developing_All_The_Applications_For_50_Billion_Devices/)]

## Enhanced Service Delivery Platforms (SDP)

- Connecting and managing networkable devices, has traditionally been a problematic area for customers.
  - In the past, it took several months to get a device network certified. Once the device was connected, there was often little visibility into how it was performing on the network, as well as, limited back end control.
- SDPs provide **configuration services**, **provisioning**, SIM management and reporting, billing, **upgrades**, and basic asset-related application services.

“Next Generation Platform Innovation In M2M”, whitepaper, Harbor Research, Inc.  
[<http://www.harborresearch.com/HarborContent/whitepapers.html>]

## Application Development & Delivery

- Today, IoT **applications are cumbersome and complex to develop.**
  - Whether the application is developed by the company deploying it or a third party, they are very custom in nature and often configured for the environment in which they operate.
  - Application development for connected devices today entails a very high level of engineering complexity
- Smart system application development has focused primarily on ... technology for provisioning, management and billing for connected devices – ... [but needs] **application development and application services delivery.**

“Next Generation Platform Innovation In M2M”, whitepaper, Harbor Research, Inc.  
[<http://www.harborresearch.com/HarborContent/whitepapers.html>]

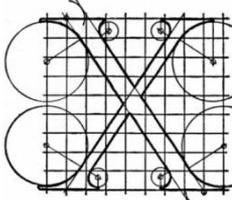

- The Wu-Kong project is to build an *Intelligent Virtual Middleware* for M2M, that can
  1. recognize heterogeneous devices in connection, user context and needs;
  2. configure and transform devices into service components;
  3. adapt and distribute app codes to achieve the best result;
  4. do all of the above via remote access to sensors.
- Another goal is to use the Wu-Kong middleware as the foundation of next generation M2M application development for constructing
  1. high level code that is sensor- and context-independent
  2. dynamic code that evolves with sensor capabilities and missions

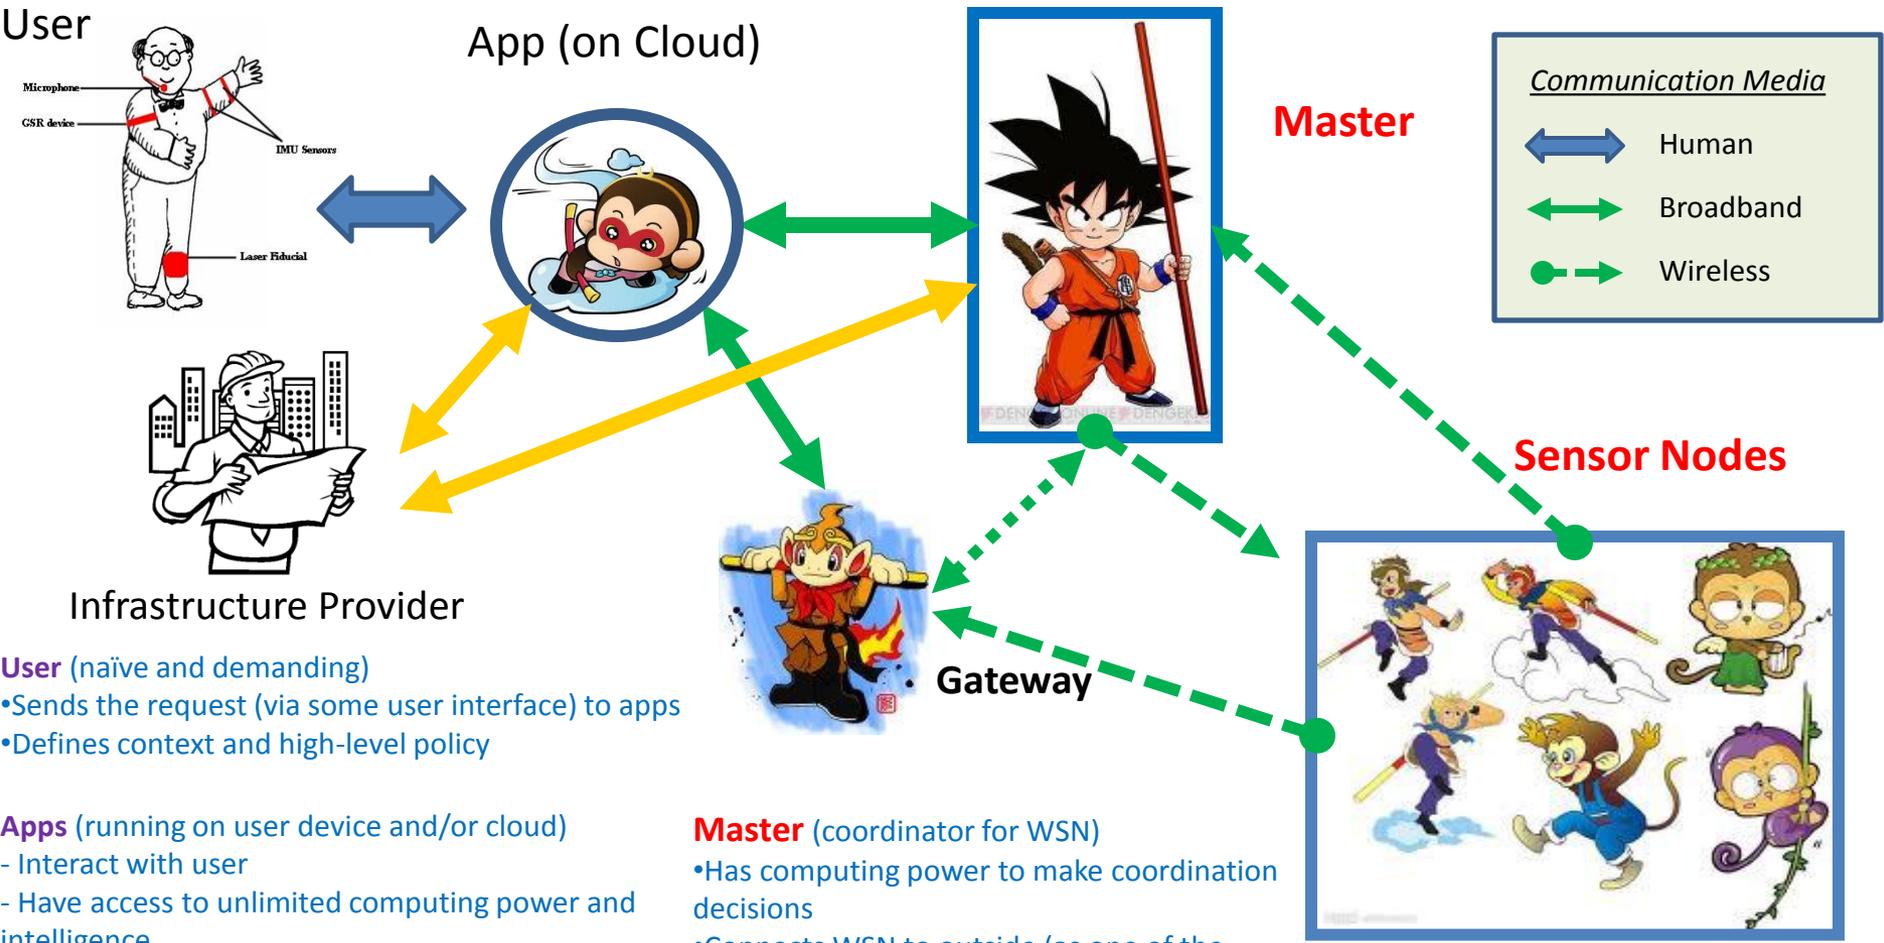

# Goal for Current Stage: Self-X M2M

- The objective is “**zero-cost deployment**” (i.e., cost refers to human effort)
  - Problem: manual effort is often the bottleneck in large-scale deployment and long-term sustainability of M2M systems in the field.
- The project is to provide an **intelligent M2M framework**
  - Self-X stands for self-configuration, -protection, -healing, and -optimization for sensor nodes and gateways.
- Based on **user-defined policy and context**, the proposed platform services automatically perform
  - sensor node and network configuration,
  - application deployment,
  - fault handling, and
  - system reconfiguration.

Self- = configuration, protection, healing, optimization

# Wu-Kong: Who's Who

**User** (naïve and demanding)  
 •Sends the request (via some user interface) to apps  
 •Defines context and high-level policy

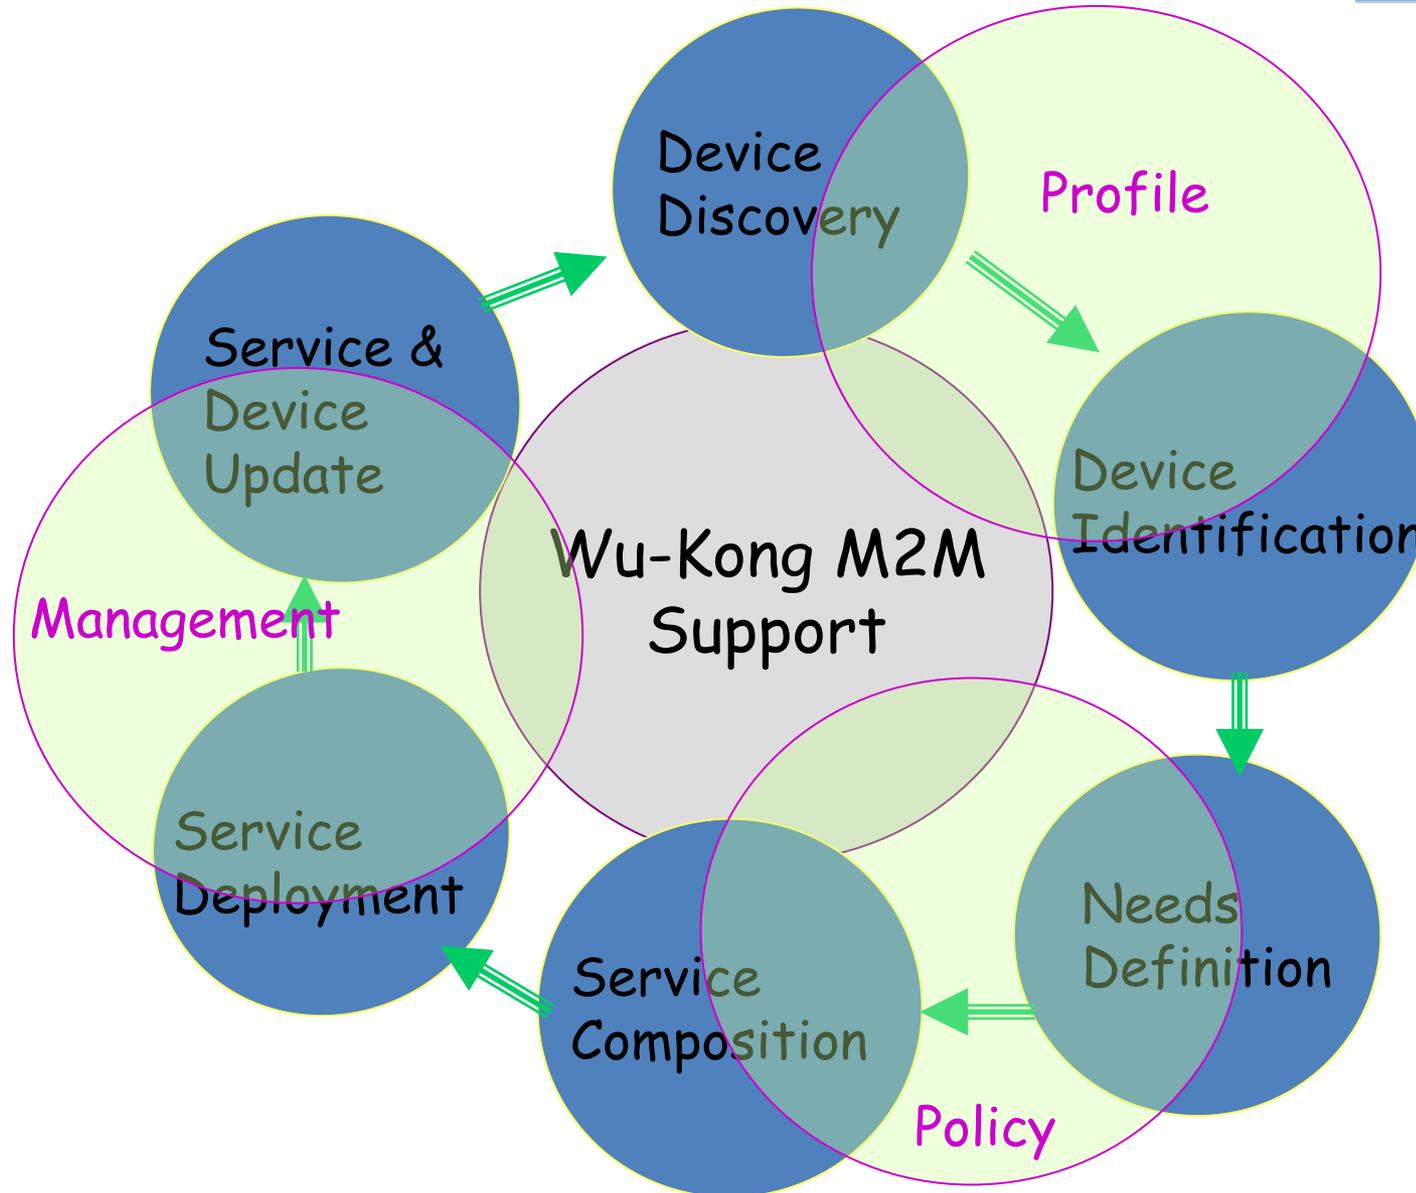

**Apps** (running on user device and/or cloud)  
 - Interact with user  
 - Have access to unlimited computing power and intelligence

**Nodes** (sensor devices)  
 •Physical world sensing and actuating  
 •Need only limited computing power to sense/send data

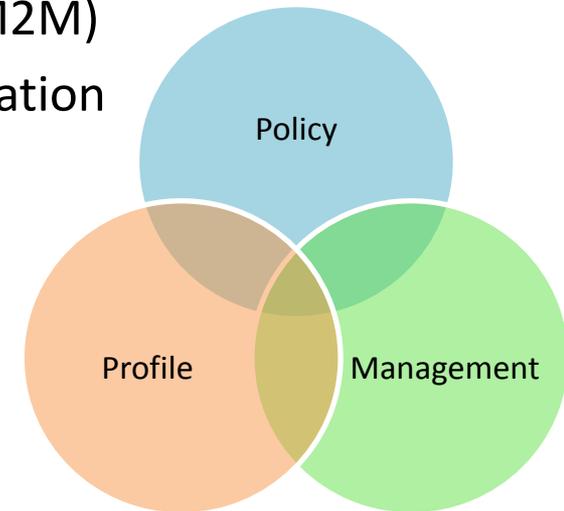

**Master** (coordinator for WSN)  
 •Has computing power to make coordination decisions  
 •Connects WSN to outside (as one of the Gateways)

**Gateway** (Cohort for Master)  
 •provides extra computing/connection  
 •provides backup coordination

**Infrastructure Provider**  
 •provides management support  
 •needs provision and self-X control

- **Profile** Framework (abstraction for heterogeneous nodes)
  - Device classes (capabilities): discover, share and control
  - Heterogeneous and virtual sensor sharing
- **Policy** Framework (adaption for M2M context)
  - Configuration decision and constraint optimization
  - Configuration <-> fault tolerance, security, trust
- **Management** Framework (embedding intelligence in M2M)
  - Sensor to Master to cloud distribution and coordination
  - Tools for application access and control anywhere, anytime

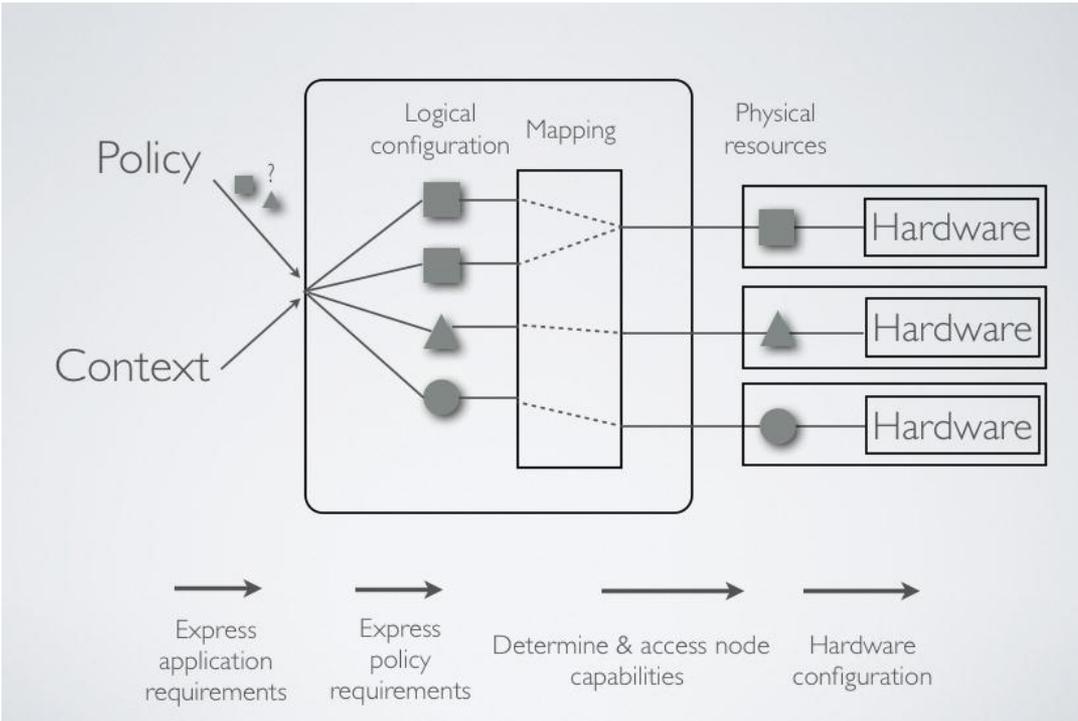

- Abstraction for heterogeneous sensor nodes so that Master can discover, access and control them
- Related work: uPnP (2006), DPWS (2006), WSDD (2008), TinyDB (2005), sMAP (SenSys 2010)
  - uPnP provides a service-oriented architectural framework for self-configuring, self-describing devices on top of TCP/IP, HTTP and SSDP
  - WSDD defines a lightweight version of DPWS using Web service framework
  - sMAP defines a RESTful interface for universal device access
- Complexity and machine self-automated are critical for Wu-Kong
- We want to implement a general and extensible profile framework
  - **“BIOS” for sensors:** *(from wiki)* “When the PC starts up, the first job for the BIOS is to **initialize and identify system devices** such as the video display card, keyboard and mouse, hard disk drive, optical disc drive and other hardware. The BIOS then **locates boot loader software** held on a peripheral device (designated as a 'boot device'), such as a hard disk or a CD/DVD, and **loads and executes that software**, giving it control of the PC.”

- To configure the M2M network, Master needs to be able to determine what sensor resources are available.
- Three phases:
  1. Determine what devices are on the network (*discovery*)
  2. Determine what those devices can do (*profile*)
  3. Determine what those devices should do (*policy*)
- We separate the discovery of nodes from the profile because
  - discovery may depend on the scenario
  - discovery may depend on the specific network technology used
  - handful of nodes at home vs thousands for environmental monitoring
- After Master has "discovered" devices and queried them, each device profile provides:
  - A way to determine what resources are available on a device
  - A way to access to those resources

- In Wu-Kong, each profile represents a single capability on a device.
  - Multiple profiles, possibly at the same time, can be present on a single device.
  - *E.g.* two temperature sensors with different characteristics (accuracy, power, etc), results in two "Temperature Sensor" profiles with different content
- **Logical vs. Physical** sensor devices
  - Each physical sensor device can be used to serve one or more profiles
  - Each application is designed to run with some logical devices, each defined by a profile
  - *E.g.* An application is designed to read data from a logical "temperature sensor" and a logical "light sensor". In the target system, however, there may be a physical device with both "temperature sensor" and "light sensor" profiles.
- A profile model is defined by a data structure
  - Similar to Zigbee and S-Map (*in contrast to Z-Wave and enOcean, which define the profile as a list of service operations*)
  - Each physical device stores its profile data in a protected area in its device memory
  - Each application is compiled to produce a list of required logical devices.
  - There must be a binding between logical and physical devices (both are expressed in the well-defined profile data structure) before application execution.

# Binding in the Profile Framework

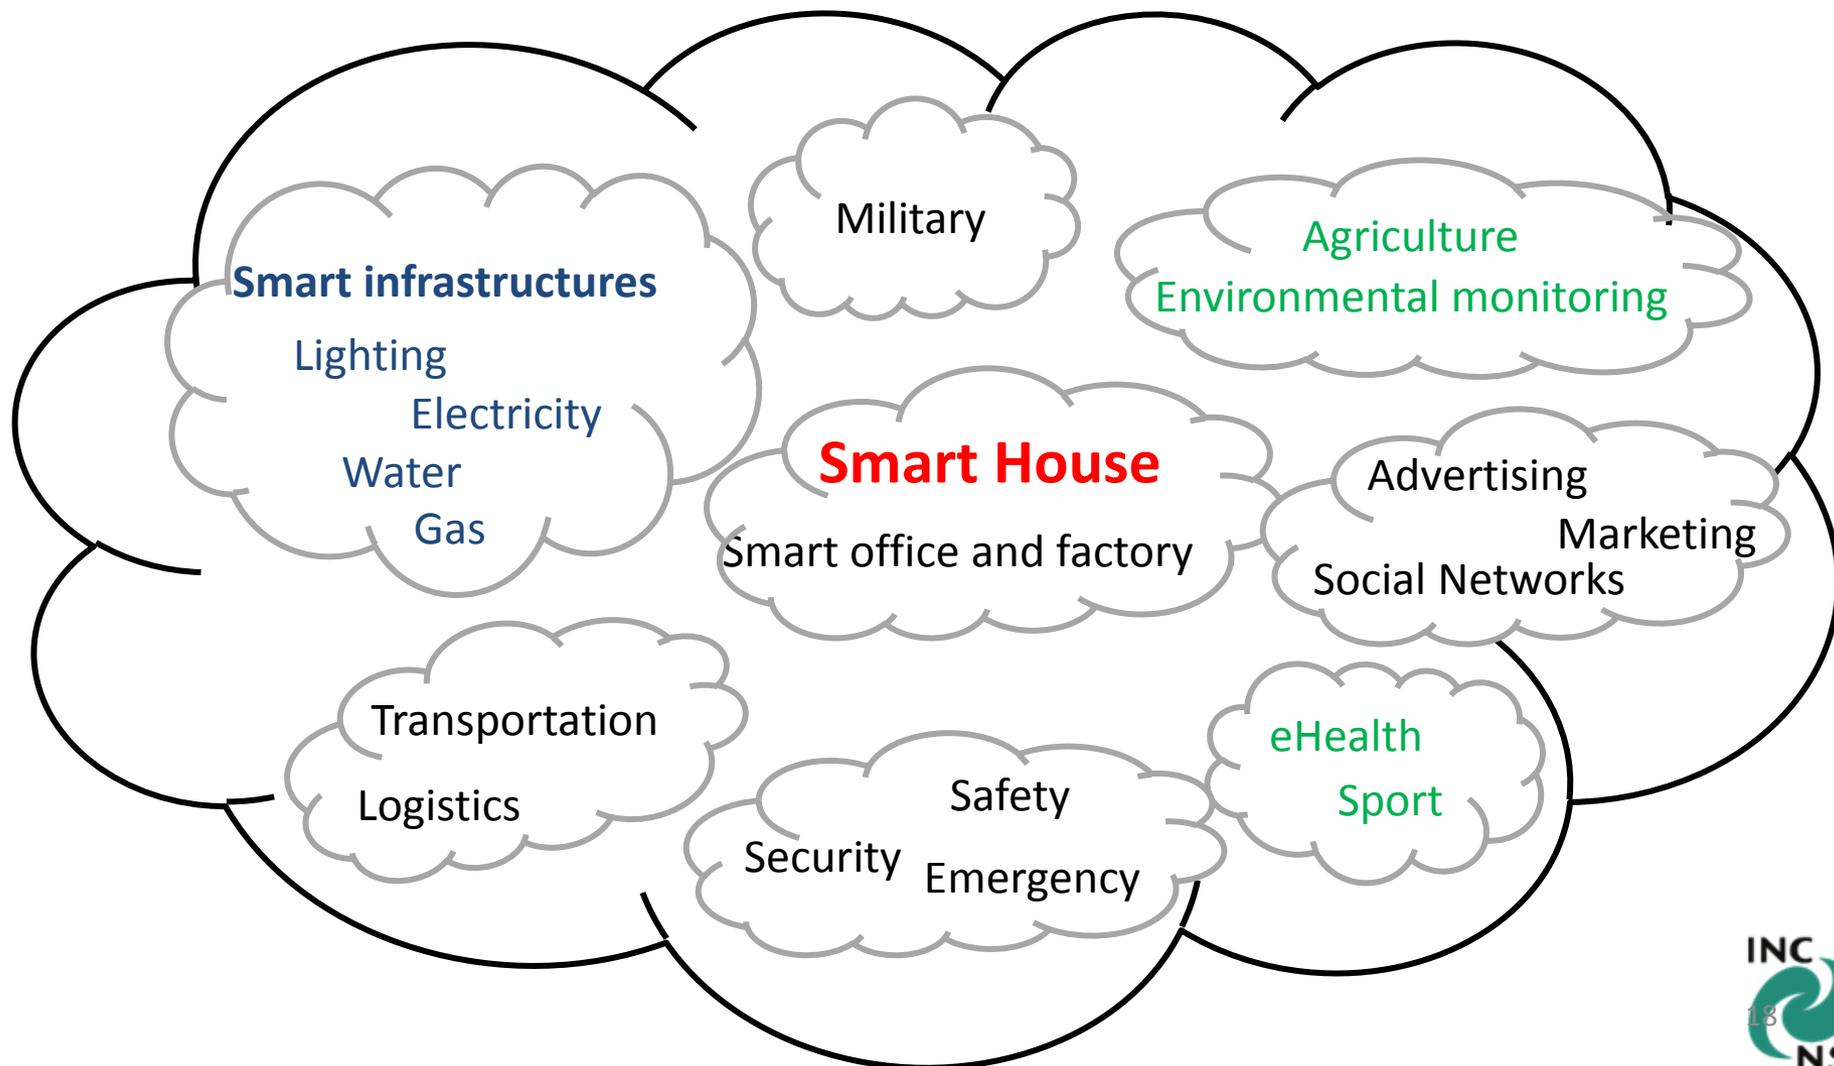

- The application and context are used to produce a logical configuration of profiles
- Logical devices must be mapped to physical sensor nodes available on network with compatible profiles
- Mapping can be 1-1, n-1, 1-m, or n-m

- In Wu-Kong, each profile may have three different types of data:
  1. A *common* profile is present on all devices, describing basic properties
    - CPU speed, Memory size, Power rating, Connectivity media, etc.
  2. Some *specific* profiles are present to expose a device's specific features
    - Temperature Sensor, Humidity Sensor, AC controller, etc.
  3. Master can add *extended* profile to expand a device's capability
    - e.g. integrate Motion Sensor and Light Sensor into a Sleep Sensor
    - Functionality beyond the device's original hardware design can be added by uploading function code to a device.
- Such a functionality is referred as an “*extended*” profile
  - This profile isn't (directly) tied to the node's hardware
  - It is implemented in software (dynamically loaded code)
- In this way virtual sensors can be implemented, combining data from different sensor sources into a new 'sensor'.

- High level specification for M2M management
  - User or app defines an intuitive objective statement
  - Policy interpreter and configuration engine produce the detailed setup for target systems, enabling higher-level thinking/coding
  - By specifying policies declaratively and independent of actual devices, it is possible to change the behavior on-the-fly for better flexibility.
- Related work: Security (SPF), OS Policy, Ponder/Ponder2 (2001/2006), DSN (SenSys 2007), ADAE (SenSys 2010)
- Configuration and constraint satisfaction engine can take many attributes (e.g. context, fault tolerance, security, trust) into consideration for a better, more optimal performance

## A smart home utility: User Comfort at Home

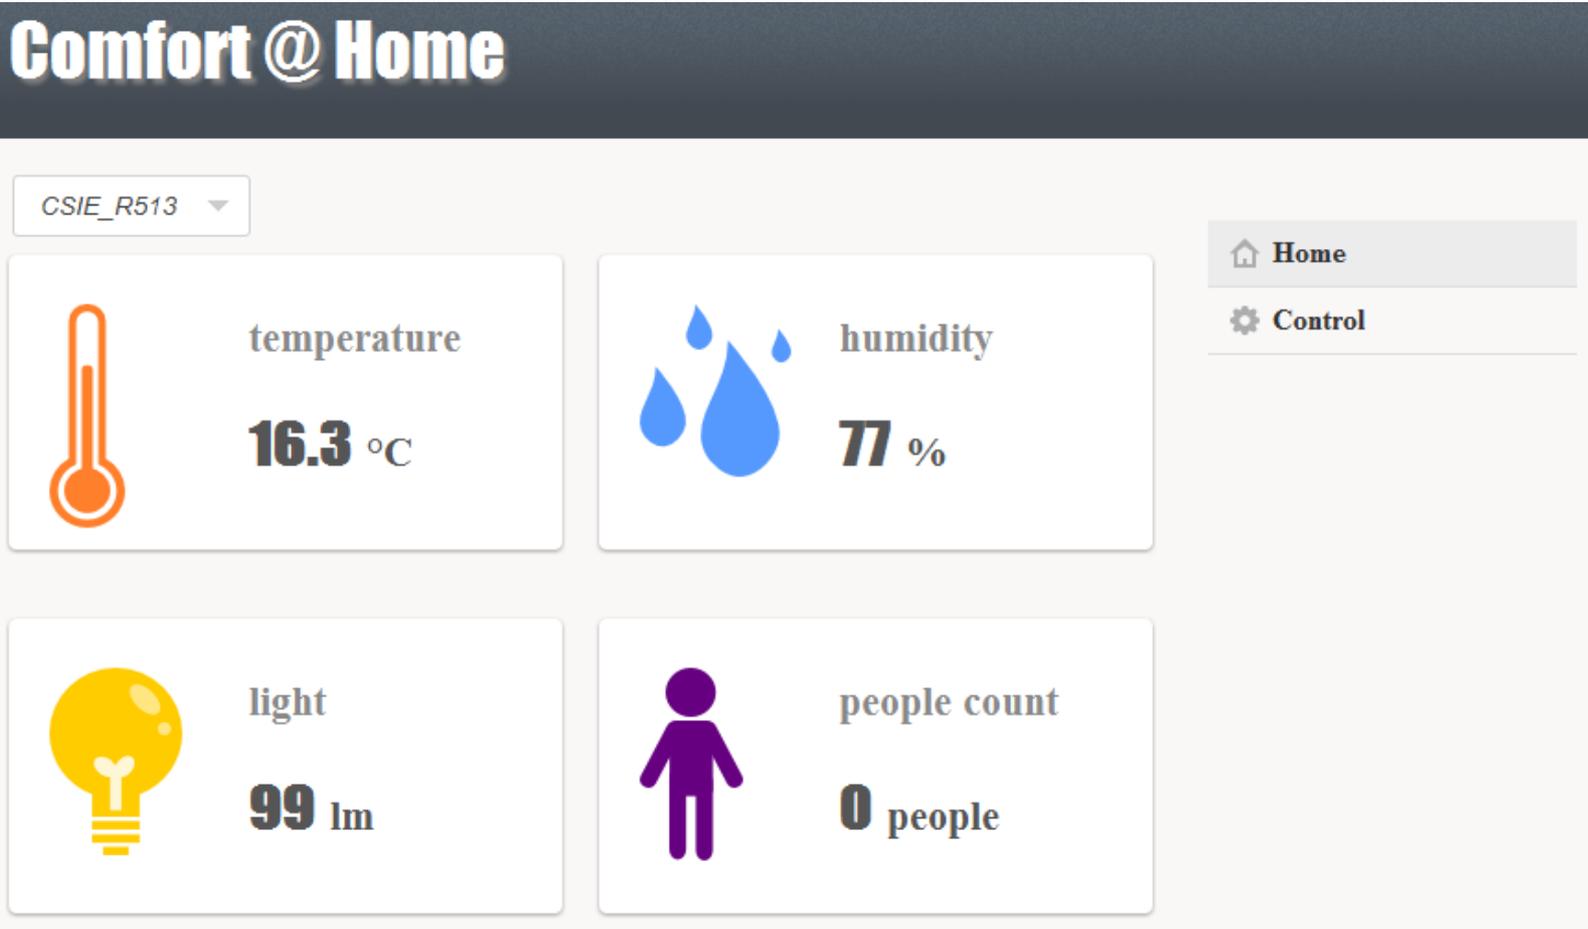

- **What to monitor**
  - human presence
  - motion
  - light
  - temperature
  - humidity, CO<sub>2</sub>
- **What to change**
  - if someone is there, set the appropriate comfort level
  - turn lamps on and off as needed
  - turn fans on and off as needed
  - ...

- User go to the “control” page to see the deployment of sensors in each room, as well as actuators and policy.

- The dashboard page shows the reading of each sensor in the room.

The screenshot shows a dashboard titled "Comfort @ Home" for room "CSIE\_R513". It features four sensor data cards: temperature (16.3 °C), humidity (77%), light (99 lm), and people count (0 people). A sidebar on the right contains "Home" and "Control" navigation options.

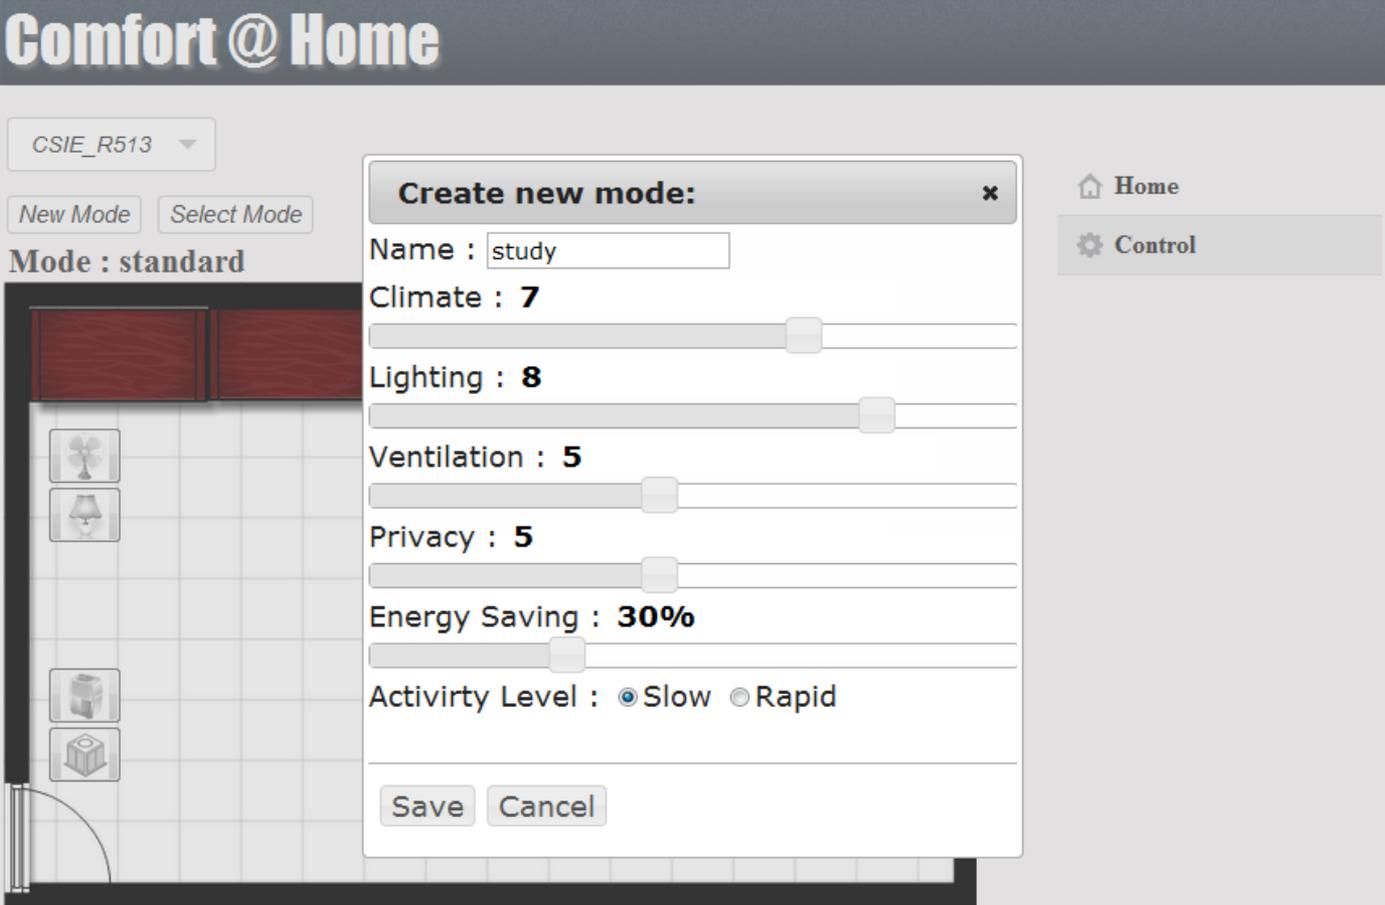

Sensor	Reading
temperature	16.3 °C
humidity	77 %
light	99 lm
people count	0 people

- User and Master can see/use historical data to help them make more intelligent decisions.

- User creates a **mode** definition with desirable attribute values, then clicks the “Save” button.

The screenshot displays the 'Comfort @ Home' interface. A 'Create new mode:' dialog box is open, showing the following configuration for a new mode named 'study':

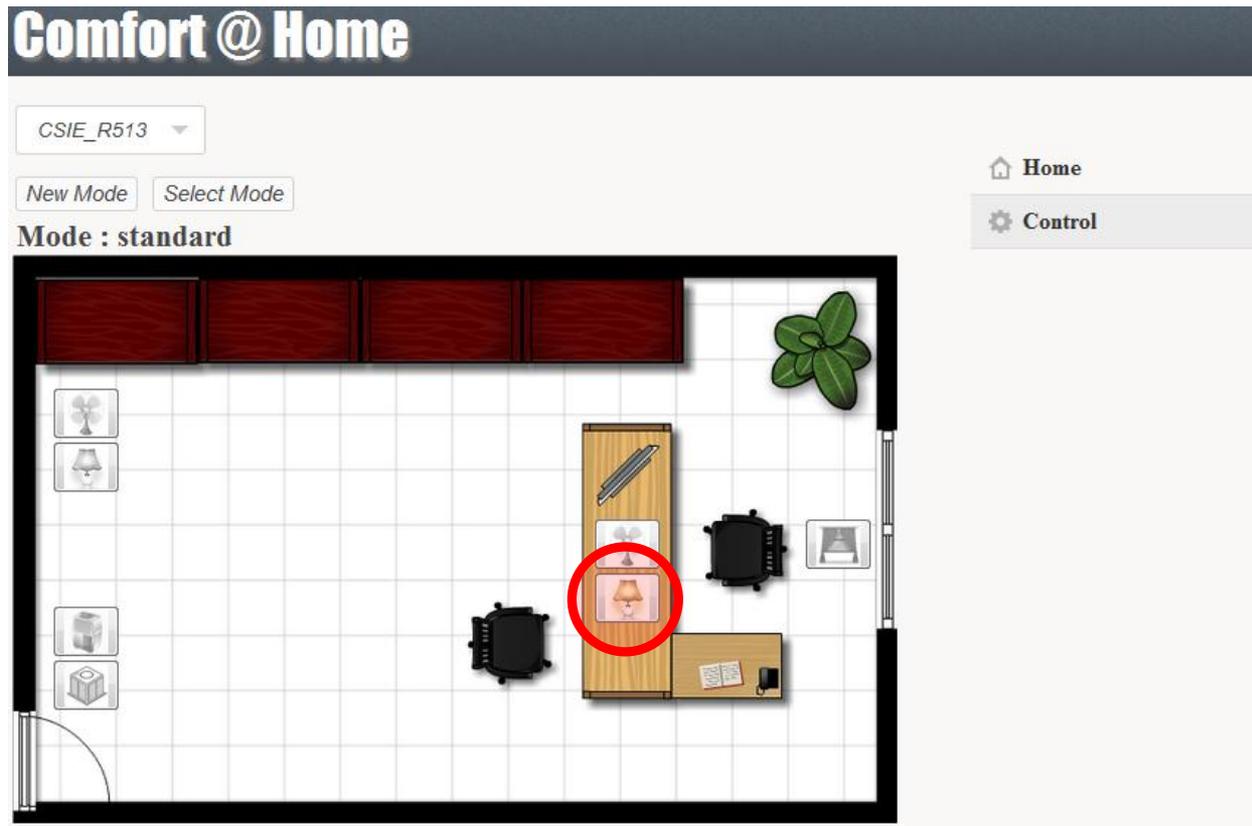

- Name : study
- Climate : 7
- Lighting : 8
- Ventilation : 5
- Privacy : 5
- Energy Saving : 30%
- Activity Level :  Slow  Rapid

The 'Save' button is highlighted in the dialog box. The background interface shows a room layout with various control icons and a sidebar with 'Home' and 'Control' options.

- The user or application can change mode dynamically: switching to “**away**” mode will preserve more energy and increase security level.

The screenshot displays the 'Comfort @ Home' web interface. At the top left, the title 'Comfort @ Home' is visible. Below it, there is a dropdown menu showing 'CSIE\_R513'. Two buttons, 'New Mode' and 'Select Mode', are present. The current mode is indicated as 'Mode : standard'. On the right side, there are navigation buttons for 'Home' and 'Control'. A modal dialog box titled 'Select your mode:' is open in the center, listing four options: 'standard', 'gone', 'sleep', and 'study'. The 'gone' option is selected and highlighted with a red circle. At the bottom of the dialog, there are 'Switch' and 'Cancel' buttons. The background shows a floor plan with various room icons like a fan, lamp, and desk.

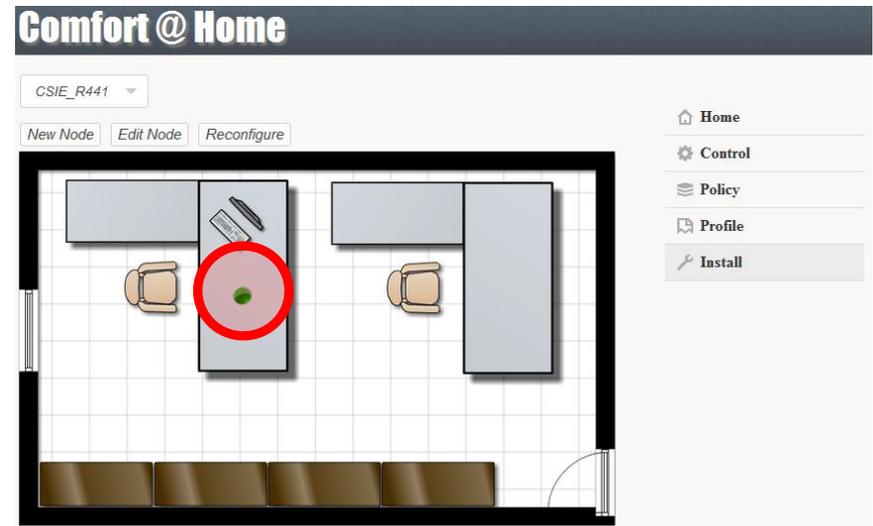

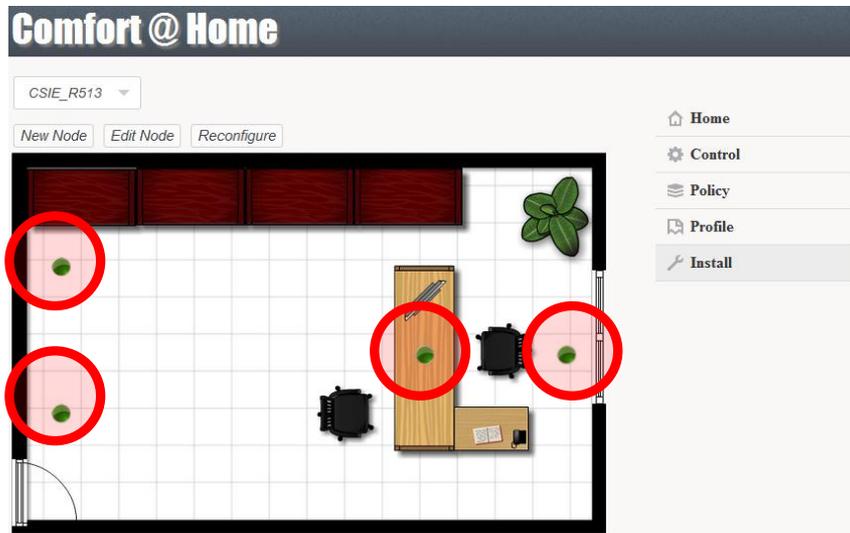

- A lamp can be manually controlled. If the user thinks it's too dark, he can turn on the lamp by clicking on the icon.
- The application can learn user's needs and adjusts its policy accordingly.

- Installer can change the policy setting, profile specification and deployment.

The screenshot displays the 'Comfort @ Home' web interface. At the top left, the title 'Comfort @ Home' is visible. Below it, a dropdown menu shows 'CSIE\_R513'. The main content area is divided into four panels: 'temperature' (16.3 °C), 'humidity', 'light' (99 lm), and 'people' (0). A modal dialog box titled 'Check your password:' is overlaid on the temperature panel. It contains two input fields: the first contains 'installer' and the second contains masked characters. Below the fields are 'Login' and 'Back' buttons. On the right side, there is a navigation menu with 'Home' and 'Control' options.

- Installer can see the whole deployment with node-view. They are not allowed to see the mode status unless the user allows it.

- Installer can add new nodes if he has the right authority. He can enter the information in a node profile.
- The binding between logical and physical sensors are now manually configured and should be automatically configured after WuKong's profile framework is deployed.

**Comfort@home** Add new node: [x]

ID:

Location:

Sensor:

temperature: digital.6, humidity: digital.7

Actuator:

fan: digital.8

# What's the profile specification?

- In our demo application, we have...
  - Node
    - A detailed information with node ID and location.
    - What sensors and actuators on this node can be controlled.

node_ID	location	sensor	actuator
0001	CSIE_R513	[temperature: D.6, humidity: D.7, light: A.2, sound: A.4, motion: D.4]	[fan: D.10, lamp: D.12, monitor: D.8]
0002	CSIE_R513	[temperature: D.6, humidity: D.7, light: A.2, sound: A.4, motion: D.4]	[fan: D.10]
0003	CSIE_R441	[temperature: D.6, humidity: D.7, motion: D.4]	[fan: D.10]

# What's the profile specification?

- In our demo application, we have...
  - Sensor
    - A detailed information with sensor ID, location and pin number.
    - Sampling period, type, valid range, sensitivity, voltage, power resource, attribute, etc... so sensors can be designated for different functionality/applications.

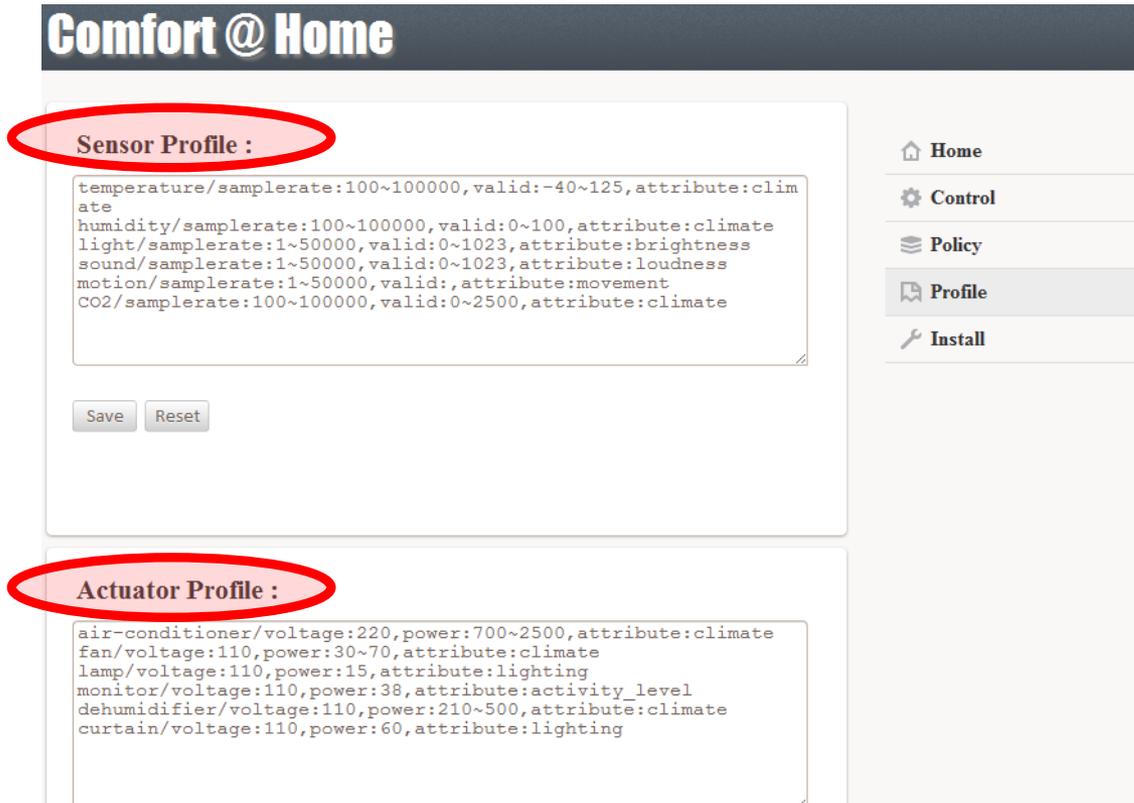

sensor_ID	sensor_name	sample period	type	valid range	attribute
0001	temperature	100 ms	digital	[-40,125] °C	climate
0002	humidity	100 ms	digital	[0,100] %	climate
0003	CO2	100 ms	analog	[0,2500] ppm	climate
0004	light	1 ms	analog	[0,1023] lumen	lighting
0006	motion	1 ms	digital	0,1	activity_level

# What's the profile specification?

- In our demo application, we have...
  - Actuator
    - A detailed information with actuator ID, location and pin.
    - Voltage, power, power resource, attribute, etc... so actuators can be designated for different functionality/applications.

actuator_ID	actuator_name	voltage	power	power resource	attribute
0001	air-conditioner	220V	[700,2500] W	wall socket	climate
0002	fan	110V	[30,70] W	wall socket	climate
0003	lamp	110V	15 W	wall socket	lighting
0004	dehumidifer	110V	[210,500] W	wall socket	climate
0005	curtain	110V	60 W	wall socket	lighting

- Installer can add new sensor in the profile page, and save its hardware specification.

The screenshot displays the 'Comfort @ Home' web interface. The main content area is divided into two sections: 'Sensor Profile' and 'Actuator Profile', both highlighted with red ovals. The 'Sensor Profile' section contains a text area with the following configuration: temperature/samplerate:100~100000, valid:-40~125, attribute:climate; humidity/samplerate:100~100000, valid:0~100, attribute:climate; light/samplerate:1~50000, valid:0~1023, attribute:brightness; sound/samplerate:1~50000, valid:0~1023, attribute:loudness; motion/samplerate:1~50000, valid:, attribute:movement; CO2/samplerate:100~100000, valid:0~2500, attribute:climate. Below the text area are 'Save' and 'Reset' buttons. The 'Actuator Profile' section contains a text area with the following configuration: air-conditioner/voltage:220, power:700~2500, attribute:climate; fan/voltage:110, power:30~70, attribute:climate; lamp/voltage:110, power:15, attribute:lighting; monitor/voltage:110, power:38, attribute:activity\_level; dehumidifier/voltage:110, power:210~500, attribute:climate; curtain/voltage:110, power:60, attribute:lighting. To the right of the main content area is a vertical navigation menu with icons and labels for 'Home', 'Control', 'Policy', 'Profile' (which is highlighted), and 'Install'.

**Comfort @ Home**

**Sensor Profile :**

```
temperature/samplerate:100~100000, valid:-40~125, attribute:climate
humidity/samplerate:100~100000, valid:0~100, attribute:climate
light/samplerate:1~50000, valid:0~1023, attribute:brightness
sound/samplerate:1~50000, valid:0~1023, attribute:loudness
motion/samplerate:1~50000, valid:, attribute:movement
CO2/samplerate:100~100000, valid:0~2500, attribute:climate
```

Save Reset

**Actuator Profile :**

```
air-conditioner/voltage:220, power:700~2500, attribute:climate
fan/voltage:110, power:30~70, attribute:climate
lamp/voltage:110, power:15, attribute:lighting
monitor/voltage:110, power:38, attribute:activity_level
dehumidifier/voltage:110, power:210~500, attribute:climate
curtain/voltage:110, power:60, attribute:lighting
```

# Policy – Triggering Conditions

- Installer can manually edit the triggering conditions with each actuators.

The screenshot shows the 'Comfort @ Home' web interface. The main heading is 'Comfort @ Home'. Below it, there is a section titled 'Policy - Triggering Conditions' which is circled in red. This section contains a text area with the following text: 'air-conditioner/temperature humidity AND CO2 OR lamp/light NOT motion AND monitor/motion curtain/light NOT CO2 OR dehumidifier/humidity'. Below the text area are 'Save' and 'Reset' buttons. To the right of the main content is a sidebar menu with options: Home, Control, Policy (highlighted), Profile, and Install. Below the triggering conditions section is another section titled 'Policy - Attributes' which contains a text area with the following text: 'temperature/samplerate:100~60000,threshold:20~30,attribute:climate humidity/samplerate:100~60000,threshold:40~80,attribute:climate CO2/samplerate:100~90000,threshold:600~1500,attribute:climate light/samplerate:1~10000,threshold:0~756,attribute:lighting sound/samplerate:1~5000,threshold:0~1023,attribute:loudness motion/samplerate:1~2000,threshold:0~10,attribute:activity\_level'.

# Policy – Attributes

- Installer can manually edit the attribute values if end-user have a special request, but it is still followed by profile constraints.

**Comfort @ Home**

**Policy - Triggering Conditions :**

```
air-conditioner/temperature humidity AND CO2 OR
fan/temperature motion AND
lamp/light NOT motion AND
monitor/motion
curtain/light NOT CO2 OR
dehumidifier/humidity
```

Save Reset

**Policy - Attributes :**

```
temperature/samplerate:100~60000,threshold:20~30,attribute:climate
humidity/samplerate:100~60000,threshold:40~80,attribute:climate
CO2/samplerate:100~90000,threshold:600~1500,attribute:climate
light/samplerate:1~10000,threshold:0~756,attribute:lighting
sound/samplerate:1~5000,threshold:0~1023,attribute:loudness
motion/samplerate:1~2000,threshold:0~10,attribute:activity_level
```

  - *NanoKong VM (discussed next)*
- Security assessment

# NanoVM: A Very Simple VM

- Built for simplicity
  - NanoVM is an open-source implementation of the JVM. The NanoVM was initially developed to run on the Atmel AVR ATmega8 used in the Asuro Robot. It was ported to run on the C't-Bot and the Nibo-robot
  - NanoVM 1.6 released on July 2007 with Asuro ATmega168 support
  - Very small (8-16K code, 768 bytes RAM)
    - Fit on almost any sensor platform
  - Very simple architecture
    - Easy learning curve
    - Easy to port, adapt and extend
  - *Rather slow*
- Simplicity and flexibility make it ideal for initial designs.
- Several options exist to improve performance.

# NanoKong – VM for *Wu-Kong* Sensors

- Porting NanoVM to Arduino
  - Completed
- Arduino IO
  - Completed: Added support for most IO functions present on Arduino but originally not supported by NanoVM
  - Working on: low-power mode
- Radio
  - Completed: Generic interface to support multiple radio technologies
  - Completed: Z-Wave support
  - Working on: Zigbee support
- Code update
  - Completed: Uploading new code, replacing the complete Java program
  - Working on: blocks of code to implement extended profiles

# Research Team

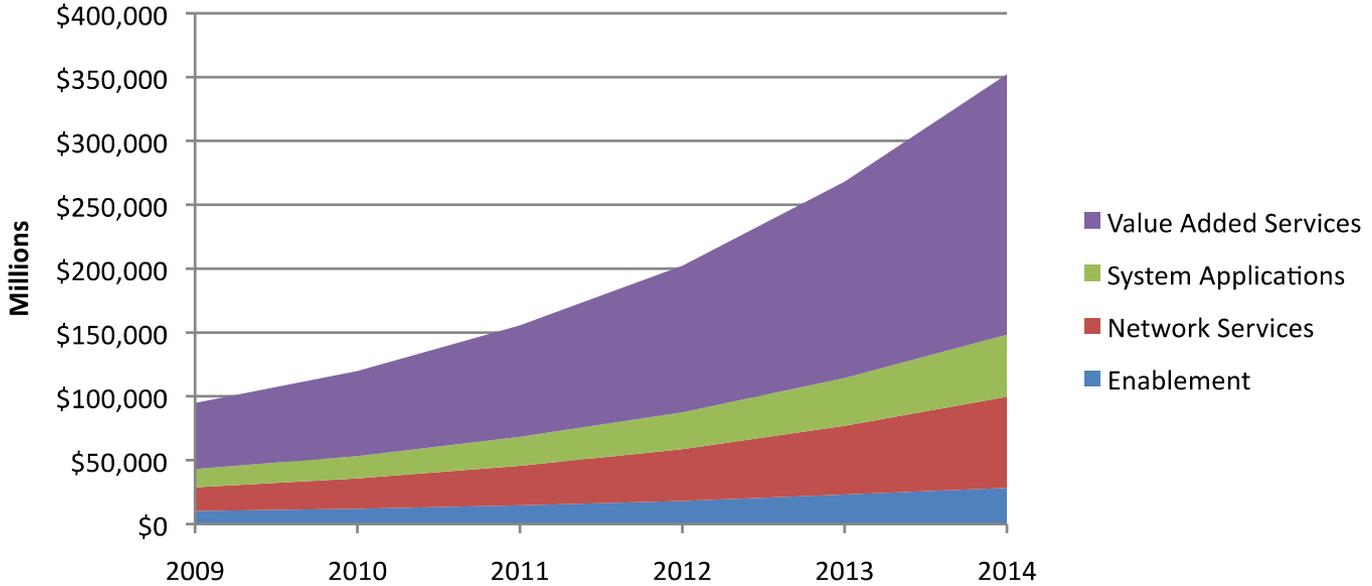

- Dr. Kwei-Jay Lin (Professor, UC Irvine & NTU; Ph.D. Maryland)
- Dr. Daniel Shih (Associate Professor, NTU; Ph.D. Illinois)
- Dr. Jane Hsu (Professor, NTU; Ph.D. Stanford)
- Dr. Yu-Chung Wang (Senior Researcher, Ph.D. UC Irvine)
- Niels Reijers (PhD student)
- Tiffany Yi-Ting Tsao (PhD student)
- Penn Su (MS student)
- Yi-Long Tsai (MS student)
- Bo-Lun Tsai (MS student)
- Guan-Fan Wu (MS student)

# Conclusion: M2M Future

- M2M future is on many new services to be deployed
- Wu-Kong is our answer to this grand challenge of building an intelligent M2M platform
- Users can benefit by receiving optimal services
- Operators can benefit by providing more efficient and effective services
- New programming paradigm is needed to unleash the full power of future M2M systems
