Outline

- Biogeography-Based Optimization
- Opposition-Based Learning
- Opposite Points
 - Definition
 - Probabilistic Comparison
 - Effects of Dimension
- Empirical Results
- Conclusion

Biogeography-Based Optimization

- Application of biogeography to evolutionary algorithms
- Immigration and emigration of species between islands (solutions) for better habitats
- Can match or outperform other EAs
 - Markov analysis [1]
 - Experimental studies [2]

Opposition-Based Learning

- Designed for reinforcement learning in neural networks [3]
 - Already used in other EAs and demonstrated good convergence properties [4].
- Utilize opposite numbers to converge to the solution
- Hypothesis: “Opposite numbers are more likely to be closer to the solution than random ones”
 - Thus, by comparing a number to its opposite, a smaller search space is needed to converge to the right solution(s).

Definition of Opposite Points

Let \hat{x} be any real number between $[a, b]$,

Opposite point:

$$\hat{x}_o = a + b - \hat{x}$$

Quasi-opposite point:

$$\hat{x}_{qo} = \text{rand}(c, \hat{x}_o)$$

Quasi-reflected point:

$$\hat{x}_{qr} = \text{rand}(c, \hat{x})$$

Probabilistic Comparison of Opposite Points

$$E(\Pr[|\hat{x}_o - x| < |\hat{x} - x|]) = \frac{1}{2}$$

$$E(\Pr[|\hat{x}_{qo} - x| < |\hat{x} - x|]) = \frac{9}{16}$$

$$E(\Pr[|\hat{x}_{qr} - x| < |\hat{x} - x|]) = \frac{11}{16}$$

where x is global minima,

\hat{x} is EA's solution estimate,

\hat{x}_o is opposition of \hat{x}

\hat{x}_{qo} is quasi-opposition of \hat{x}

\hat{x}_{qr} is quasi-reflection of \hat{x}

Effects of Dimension on Opposite Points

Empirical Results

- Simulation Metrics
 - Mean Fc: Average number of function evaluations for successful runs
 - Success rate, SR: Ratio of number of successful runs to the number of trials
- Simulation Settings
 - 16 benchmark functions
 - 20 dimensional
 - Population size of 50
 - 50 Monte Carlo simulations

Empirical Results

Benchmark Functions	BBO		OBBO	
	Mean Fc	SR	Mean Fc	SR
Ackley	23,150	1	2,394	1
Alpine	14,293	1	9,430	1
Fletcher	-	0	-	0
Griewank	372,488	0.24	2,102	1
Penalty1	39,092	1	1,513	1
Penalty2	37,082	1	1,678	1
Quartic	168,375	1	27,050	1
Rastrigin	4,997	1	2,111	1
Rosenbrock	-	0	8,223	1
Schwefel 1.2	2,796,393	0.5	4,893	1
Schwefel 2.21	-	0	8,110	1
Schwefel 2.22	13,841	1	2,977	1
Schwefel 2.26	124,248	1	8,092	1
Sphere	4,902	1	1,240	1
Step	157,187	1	997	1
Zakharov	1,064,367	0.48	6,086	1
Mean	370,801	0.70	5,793	0.94

Conclusion

- Introduced a new Opposition-Based Learning algorithm:
 - Quasi-reflection
- Proved quasi-reflection has the highest probability of yielding an answer closer to the solution than any other OBL method
- Increased BBO's success rate from 70% to 94% while reducing the mean cost function evaluation by 98%
- Find analytical expressions for the higher dimensional probabilities
- Repeat analysis for the case when solution is not uniformly distributed
