What is...?

- **Graphical Model:** A graph representing the conditional dependence between different random variables.
- **Topic Model:** Models that discover latent semantic structure in the document collection.
- **Topic:** Probability distribution over words in the vocabulary.
- **Parametric Topic Models:** Topic models that have a fixed dimensional functional form. The dimensionality or the number of topics is specified by humans.
- **Nonparametric Topic Models:** Topic models which automatically uncover the number of dimensions or number of topics based on the data characteristic.

Experiments and Results

Datasets Comparative Methods Quantitative Results Qualitative Results

Conclusions

References

Two assumptions which many probabilistic topic models currently rely upon:

- **Bag-of-words** - Order of words is not taken into account.
- **Number of Topics** - User pre-defines this discrete value. As a result, the model restricts itself only to these latent topics.

Bag-of-words Illustration

$$P(w_1, w_2, w_3, w_4, w_5) = P(w_4, w_2, w_1, w_5, w_3) = P(w_5, w_4, w_3, w_2, w_1)$$

Limitations

- Document's semantic structure is not taken into account.
- Models cannot be used in applications such as speech recognition, text compression, etc.

First Order Markov Chain

Illustration of word order.

Mathematical Depiction

$$P(w_1, w_2, w_3, w_4, w_5) \neq P(w_2, w_1, w_5, w_4, w_3)$$

Number of Topics (K)

Limitation

User has to specify the value of K . Fixed dimensional parameter space.

Bayesian Nonparametrics in Topic Models

- 1 Nonparametric Bayesian topic models are models on an ∞ -**dimensional** parameter space
- 2 Nonparametric topic models do not assume a restricted functional form
- 3 They do have parameters. Such models allow **complexity to grow** with the data
- 4 **Hierarchical Dirichlet Processes (HDP)** model is a nonparametric topic model which **automatically discovers** the number of topics K

- Metaphor to describe the Dirichlet Process

Dirichlet Process

Dirichlet Process (DP) is a distribution over distributions

Mechanism Behind CRP

- 1 Imagine a restaurant with an infinite number of tables
- 2 First customer sits at the first table
- 3 Customer i does the following:
 - 1 Sits at previously occupied table
 - 2 Sits on a new table

- Two-stage Chinese Restaurant Process (CRP)
 - ① Customers choose tables in each restaurant
 - ② Dishes are assigned to tables among all restaurants

Mechanism Behind CRF

- A franchise where restaurants share a menu with infinite number of dishes
- First customer of each table orders a dish which is shared by all future customers sitting at that table. Different restaurants can serve the same dish.
- When a new customer comes in the restaurant, the customer either,
 - ① Sits at previously occupied table
 - ② Sits on a new table

Limitations

Order of words is not
maintained

Symbol Definitions

- k_t^d - Global dish to table assignment variable. Symbolizes sharing between clusters.
- Customers sit at tables. Table assignments indicate topic assignment.

Overview

- We propose a new **non-exchangeable** metaphor in Bayesian nonparametrics
- We introduce a notion of **Buddies** (friends) in the CRF metaphor
- We introduce a notion of **reserved** and **unreserved** tables
- Customers enter restaurant following **word order** in the document
- Buddies are assigned based on the global word co-occurrence statistics

Mechanism

- 1 Some of the customers have **pre-planned** their visit so that they can spend time together with their **good old buddies**
- 2 These buddies have already **reserved** their tables beforehand
- 3 Customers wait in the queue outside the restaurant in the same order as that of the words in a document
- 4 There might be **loners** as in CRF
- 5 Every customer carries with herself a **table**, a **buddy** and **word order** assignments

Conclusions

References

How often two words commonly occur in sequence?

- 1 Is based on the global co-occurrence information
- 2 If two friends commonly hang-out most of the time, they are buddies
- 3 In language modeling parlance, we are finding the probability for bi-gram formation
- 4 We introduce a buddy assignment variable b in the model to find buddies
- 5 Buddy assignment variable is a binary random variable

Restaurant Level Depiction with Buddies

Customer configuration (a text document)

Buddy Customers Assignment

Loners : i_1, i_9, i_{10}

Buddy Group 1 : i_2, i_3, i_4

Buddy Group 2 : i_5, i_6, i_7, i_8
