- **History of Development**
- How EDDL Technology Works
- Benefits of Approach
- Recent EDDL Advancements – Examples
- Updating Systems And Communicators
- Demonstration.

# Structure of simple analog field devices

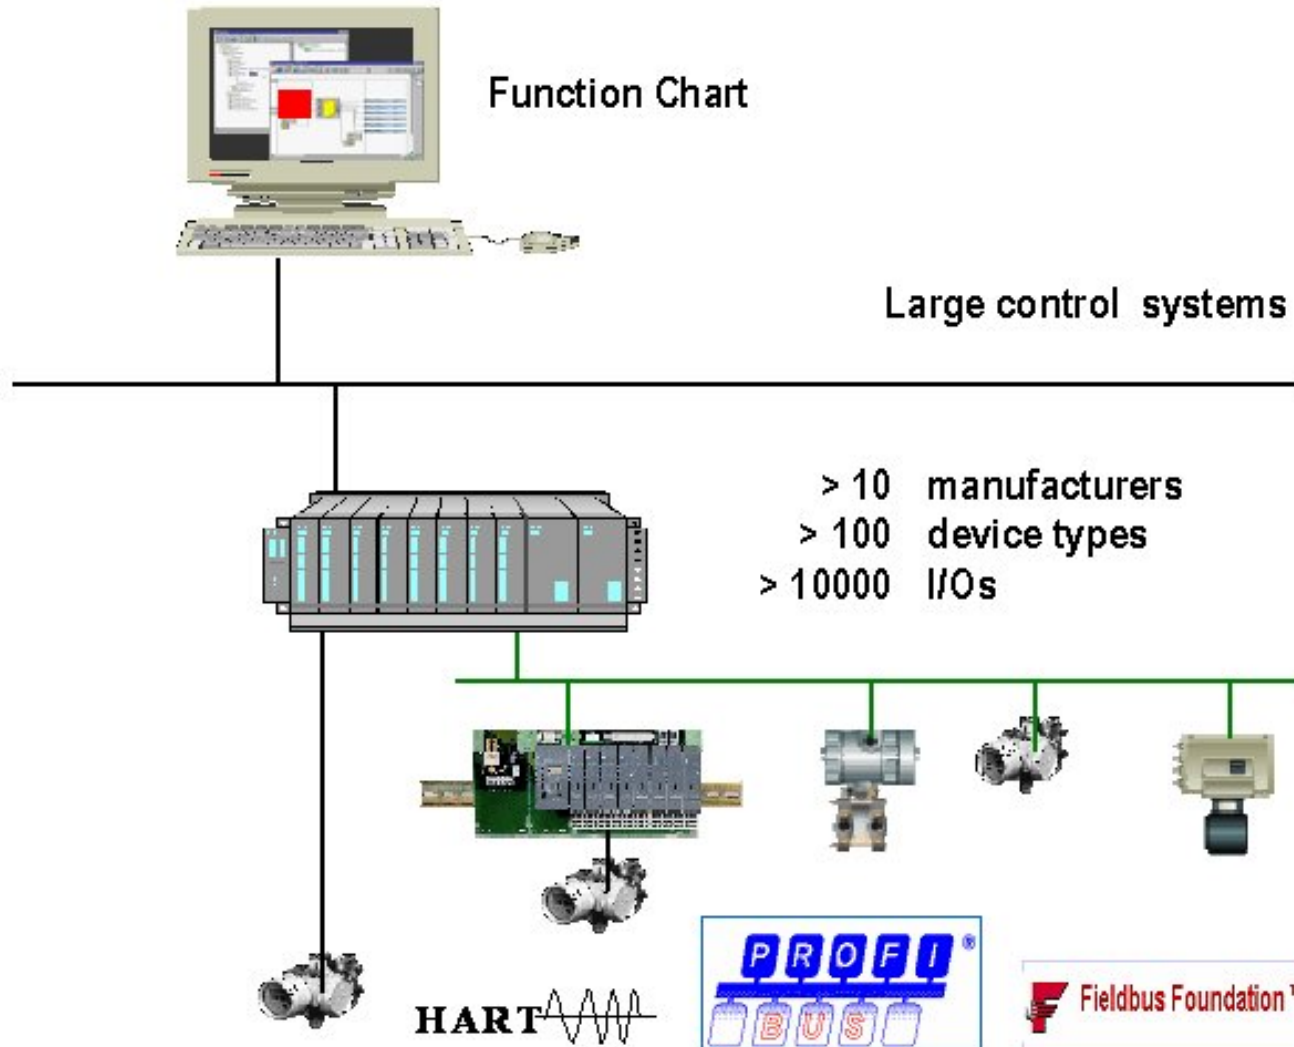

- Local calibration only
- Universal tools i.e. screw driver, meter.
- No remote diagnostic

# Structure of digital field devices

- Calibration and diagnostic parameters through communications link
- Different protocols are utilized and device implementation varies with manufacturer
- Diagnostic information is available to support on-line operation.

# EDDL – Provides a universal means to access Device Parameters

# What is EDDL? International Standard for Interoperability

- EDDL is an Electronic Device Description Language
- EDDL is an international standard
  - Standardized by IEC (IEC 61804-3)
- EDDL is endorsed by four major foundations
  - Fieldbus Foundation
  - HART Communication Foundation
  - Profibus Nutzerorganisation e.V (PNO)
  - The OPC Foundation

- Using this technology, it is possible to provide an interoperable environment where information available in modern automation sensors and actuators may be accessed by Distributed process control systems or handheld communicator to:
  - Configure
  - Calibrate a device
  - Diagnose problems
  - Provide data and alarms for user-interface displays.
- EDD's are available for more than 20 million installed field instruments from a host of manufacturers.

- Electronic Device Description technology first appeared in the early 1990's in HART instruments
- In 1994, the Fieldbus Foundation (FF), HART® Communication Foundation (HCF), Profibus Nutzer Organisation e.V. (PNO) adopted EDDL as part of their specifications.
- The Fieldbus Foundation, HCF and PNO collaborated to enhance EDDL and in 2002 submitted a unified version of EDDL to the IEC. The technology became an IEC international standard, IEC 61804-2, in March 2004

# IEC61804 Standard for Electronic Device Description

- Complies with IEC61499
- Profile are defined for Fieldbus Foundation, Profibus, and HART

- This standard specifies EDDL as a generic language for describing:
  - device parameters and their dependencies;
  - device functions, for example, simulation mode, calibration;
  - graphical representations, for example, menus;
  - interactions with control devices
  - graphical representations
  - persistent data store.
- EDDL is to be used to create Electronic Device Description (EDD). This EDD is used with appropriate tools to support parameter handling, operation, and monitoring of automation systems.

- ✓ 3.1 Investment Safety
- ✓ 3.2 Version Conflicts
- ✓ 4.1 Device Integration with Tools
- ✓ 4.2 User Guidance
- ✓ 4.3 Display of Devices
- ✓ 4.4 Standard Profiles
- ✓ 5.1 Device Descriptions
- ✓ 5.2 Licensing of Device Descriptions
- ✓ 5.3 Cross-Platform Compatibility
- ✓ 5.4 Full Support of Device Functionality
- ✓ 5.5 Standardized Data filing
- ✓ 6.0 Certification

A light blue starburst graphic with a black outline, containing the text "EDDL technology meets NE105 requirements".

EDDL technology  
meets NE105  
requirements

- Founded at the Hannover Fair in April 2004 by Fieldbus Foundation, HCF and PNO and the OPC Foundation to promote and enhance EDDL technology.

**OPC Foundation**

- **Enhanced User Interface**
  - Parameter Organization
  - Images
- **Graphing System**
  - Support for Charts and Graphs to visualize complex data
- **Persistent Data Store**
  - Archive and retrieve data
  - Aids diagnostics executed by devices

These enhancements to EDDL were approved in 2006 as a normal part of the IEC 61804-3 maintenance cycle.

## Sensor Configuration

### Sensor 1

Sensor 1 Type:	<input type="text"/>
Sensor 1 Range:	<input type="text"/>
Sensor 1 SN:	<input type="text"/>

### Sensor 2

Sensor 2 Type:	<input type="text"/>

Sensor 2 SN:	<input type="text"/>

## EDDL Cooperation

**Fieldbus Foundation**

**HCF**

**OPCF**

**PNO**

**OPC Foundation Joins Industry Cooperation Project**

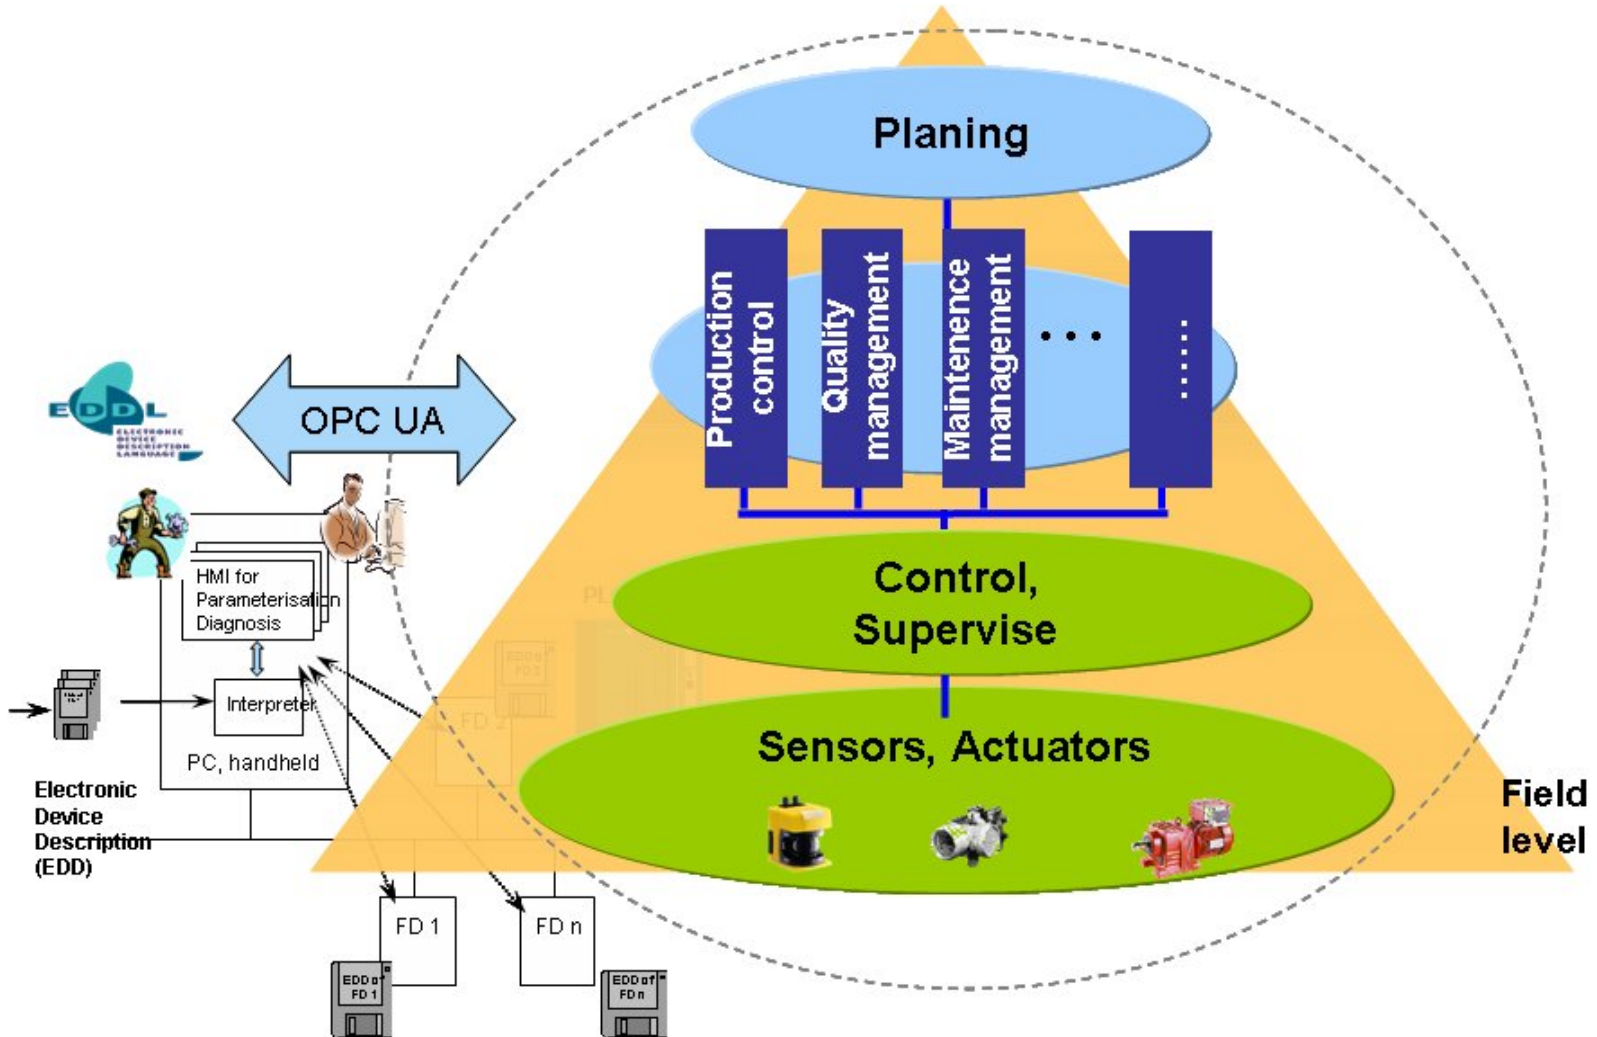

**EDD Selected as Data Structure for OPC Unified  
Architecture Specifications**

**January 2005**

- Enhanced support for devices connected to process
  - Automation systems
  - Procedures - e.g. device setup and maintenance
- Enhanced access to data references in large
  - Databases and look up tables
- Extended access to product information
  - (e.g. contact, device classification, etc.)
- Information model for OPC UA
  - Includes device and EDD information
- Support of modular devices

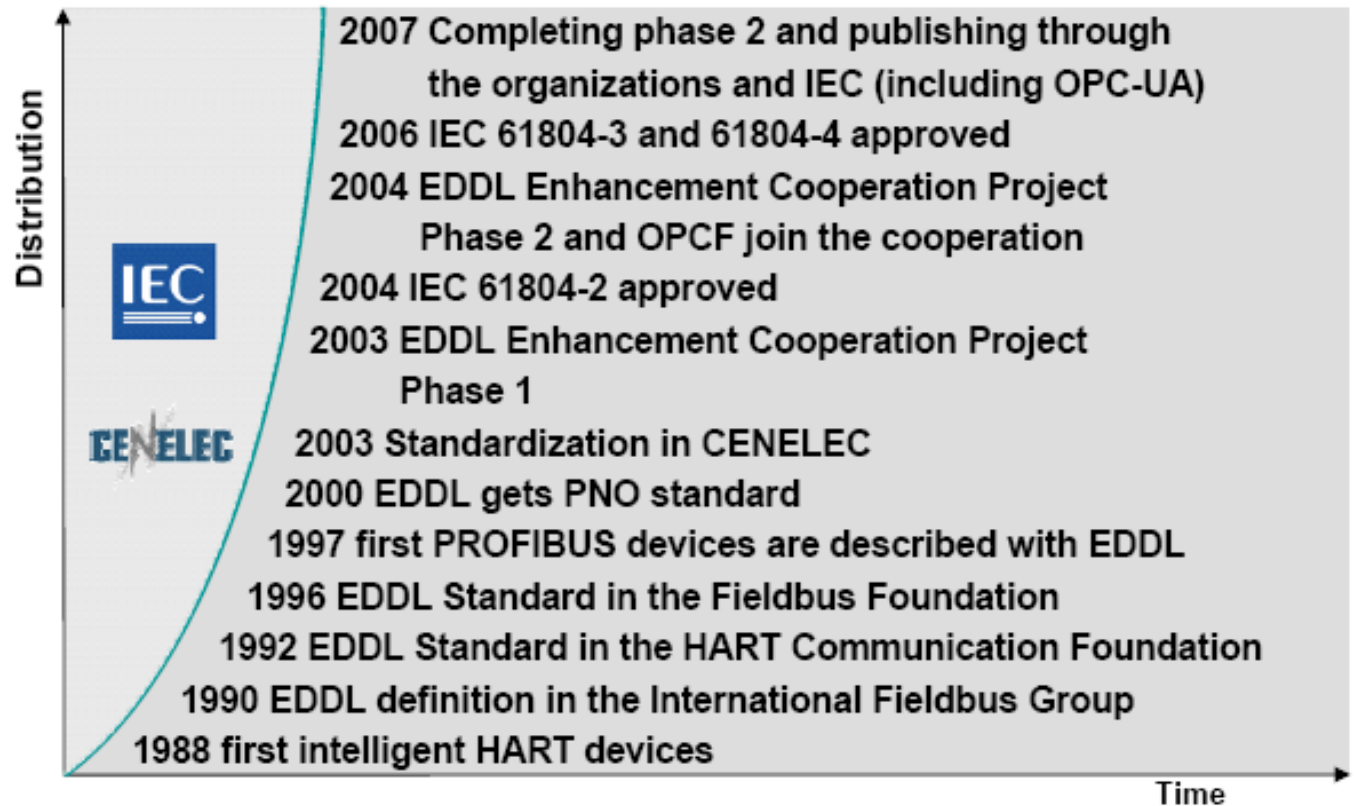

# Integration in DCS, MES using OPC UA

- ISA standards committee established in 2006 to adopt IEC 61804 for device integration.
- Committee has worldwide participation
- Committed to harmonizing its ongoing work with the IEC SC65E WG7
- IEC 61804 approved and published as an ANSI/ISA standard in June, 2007.
- The committee is committed to provide information that will help users and integrators fully utilize EDDL.

# EDDL- The Standard for Device Integration

- In 2005, the OPC Foundation announced its adoption of EDDL as the descriptive technology used in its Unified Architecture (UA). The goal is to provide a service oriented architecture that allows for exchanging data/information between manufacturing and business systems.
- The FDT Group announced at the Hanover Fair on April 17th, 2007 that they had joined the EDDL Cooperation Team to help work toward a unified solution for device integration that will use a subset of the OPC UA technology

- Foundation Fieldbus (FF) device registration requires an EDD
- EDDL is the only device description language supported by the HART Communication Foundation,
- EDD's are available for FOUNDATION, HART, and Profibus based field device.
- EDD's are available for about 1800 Foundation, HART, and Profibus devices from more than 100 manufacturers
- More than 20,000,000 EDD enables devices are in use in the process industry.
- Because of operating system independence, EDD's from 1992 are still used without changes.

# Host Applications Supporting EDDL

ABB - Industrial IT Freelance 800F  
ABB - Industrial IT System 800xA  
Emerson Process Management - 375 Field Communicator  
Emerson Process Management - DeltaV  
Emerson Process Management - Ovation  
Endress+Hauser - ControlCare  
Foxboro - I/A Series FoxCAE  
Honeywell - PlantScape  
Honeywell - Experion-PKS  
Metso - ValvGuard  
National Instruments - NI-FBUS Configurator  
Rockwell Automation - ProcessLogix  
Rockwell Automation – Logix Architecture  
Siemens – SIMATIC PCS 7  
Smar - System 302  
Yamatake - Industrial-DEO  
Yokogawa - CENTUM  
Yokogawa - STARDOM

SIEMENS

- History of Development
- **How EDDL Technology Works**
- Benefits of Approach
- Recent EDDL Advancements – Examples
- Updating Systems And Communicators
- Demonstration.

- The Electronic Device Description Language (EDDL) is a ***text-based language*** that may be used to describe the characteristics of field devices.
- Device suppliers use EDDL to create Electronic Device Description (EDD) files.
- The EDD file provides a standardized form and structure for host systems and handheld communicators to access and display information in field instruments independent of the communication protocol or device operating system.

# Interactions with individual field devices

EDDL works like SGML, HTML (web pages)

FD - Field device  
↔ Point-to-Point-Connection

- The EDD file created by an instrument or device designer uses EDDL syntax to describe a device and all its parameters in detail.
- This can include parameters such as process variable, setpoint, high-low limits, ambient temperature, etc.
- Also, EDDL supports Methods, a scripting language based on a subset of ANSI C that is used to support step-by-step, interactive setup and calibration procedures.
- Device designers can define where all the important parameters should appear on an UI display, such as in columns or bar charts, and in which order.

## Identification and Version Information

- MANUFACTURER, DEVICE\_TYPE
- DEVICE\_REVISION and EDD\_REVISION

## Data Description

- VARIABLES
  - LABEL
  - HELP
  - TYPE
  - CLASS
  - DEFAULT\_VALUE
  - MIN/MAX\_VALUE
  - UNIT
  - ACTIONS (METHODs)
- ARRAY, ITEM\_ARRAY
- BLOCK, RECORD
- COLLECTION
- LIST
- FILE
- ...

## User Interface Description

- MENU
- WINDOW, DIALOG
- PAGE, GROUP
- TABLE, GRID
- IMAGE
- CHART
  - hor. and ver. BAR
  - GAUGE
  - SCOPE, STRIP, SWEEP
- GRAPH YT, XY
- ACTIONS (METHODs)
- ...

## Communication Description

- COMMAND
  - Data ordering
  - Bit-masks and -positioning
- Upload and Download of offline and online configurations
- Ordering of COMMANDs
- Control of time conditions
- Error handling and Error messages
- Relative and absolute addressing...

# Example - Data Description

Parameter can be described with there label, help text, data type, min and max values, read/write handling, etc. The data definitions can be used in structures like BLOCK, RECORD, COLLECTION, ARRAY, LIST, FILE, etc. Any **device model** and **data archives** can be described with EDDL.

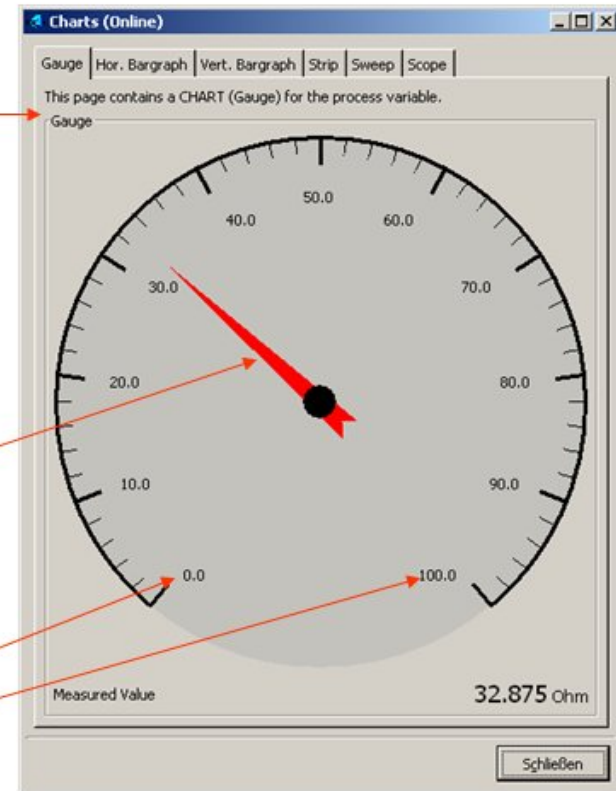

References to **text dictionaries** allows to use common wording and translations.

**Conditional expression** allows to define e.g. value ranges, read/write handling dependent of any other parameters

```
#define LINEAR 0

VARIABLE trans1_temperature_unit
{
  LABEL [digital_units];
  HELP [temperature_unit_help];
  CLASS CONTAINED;
  HANDLING READ & WRITE;
  TYPE ENUMERATED (2)
  {
    DEFAULT VALUE 32;
    { 32, [degC], [degC_help] },
    { 33, [degF], [degF_help] },
    { 34, [degR], [degR_help] },
    { 35, [Kelvin], [Kelvin_help] }
  }
  IF (trans1_sensor_type == LINEAR)
  {
    { 36, [mV], [mV_help] },
    { 37, [Ohm], [Ohm] },
    { 39, [mA], [mA_help] },
  }
}
}
```

```
CHART GaugeChartNormalSize
{
    LABEL "Gauge";
    TYPE GAUGE;
    MEMBERS
    {
        SOURCE1, chartsource1;
    }
}
SOURCE chartsource1
{
    LABEL "source 1";
    Y_AXIS chartyaxis1;
    MEMBERS
    {
        VALUE1, trans1_primary_value;
    }
}
AXIS chartyaxis1
{
    LABEL "yaxis 1";
    MIN_VALUE trans1_lower_sensor_limit;
    MAX_VALUE trans1_upper_sensor_limit;
}
```

# EDD User Interface Description

Very simply hierarchies of menus, dialogs, windows, table views with parameter groups, images, graphs, charts, etc. can be created.

The screenshot displays the EDD software interface. On the left, a tree view shows a hierarchy of 'Parameter Groups'. The main area contains a 'Tables' window with columns for 'Parameter', 'Value', 'Unit', and 'Status'. Below the table is a 'Dialogs' window with various input fields and buttons. To the right, a 'Windows' window shows a 'Graphs' window with a line plot and a 'Bar Charts' window with a bar chart. Arrows point from text labels to these specific UI elements.

Menus

Parameter Groups

Tables

Pages

Windows

Dialogs

Graphs

Buttons for Methods

Bar Charts

## Online Configuration

Online Dialogs are reading data out of the device. E.g. process data will be continuously refreshed. The user can transfer his inputs on changeable parameter to the device.

## Graphical Data Views

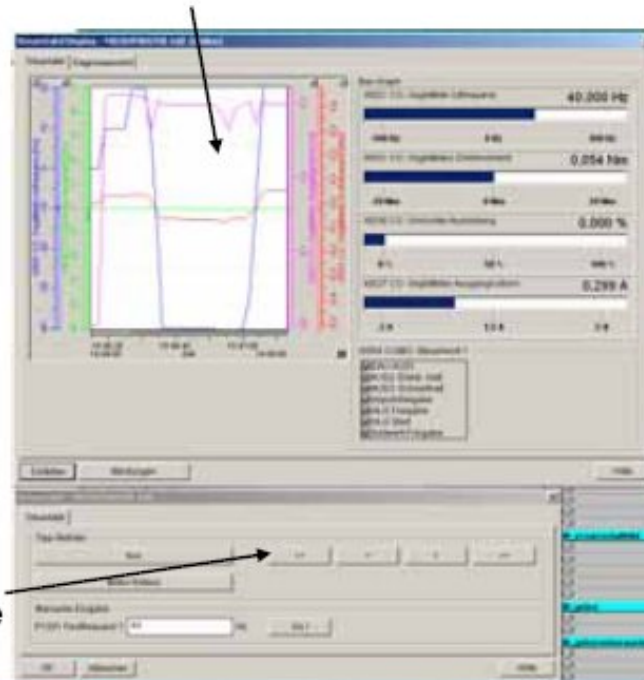

It very easy to define graphs or charts with different styles. Therefore in the EDD the ranges, unit, the data or datalist and optional some additional information have to be defined.

Through the graphical possibilities user friendly user interfaces for complex devices.

Today a large set of different device are available with EDD

- **Frequency Controller**
- **Switchgears**
- **Electrical, pneumatic and hydraulic Drivers**
- **Valve Positioners**
- **Close loop Controller**
- **Fluid and Gas Analyzer**
- **Sensors for**
  - Temperature
  - Pressure
  - Density
  - Level
  - Flow
  - etc.
- **Remote I/Os**
- etc.

Example: Control Panel of an frequency controller

Direct device control

Dynamic visualization of control flow

Toolkit available through the FF, HCF, and PNO foundations

- Permit a device developer to easily checks for syntax or logical errors in EDDL source files
- Source files may be converted into a compressed ("tokenized") binary file format to provide a more compact representation.
- Includes checking of EDDL syntax etc.
- Allows the device developer to do more complete testing, to simulate user interaction, and results in improved quality assurance

# Example – ifak EDD IDE for Developers

The screenshot displays the ifak EDD IDE interface. The main window shows a text editor with a project tree on the left and a dictionary editor on the right. The dictionary editor lists various menu items and their translations. Below the main editor, there are several test windows, including a graph showing a temperature curve and a horizontal bar chart.

**Dictionary editor content:**

Name	en	de	fr	it	es
DIC_TC2122	✓				
LIN_TYPE	✓	✓			
Main_Menu_M_Help	✓	✓

**TestWindow TC\_0408 (Label) Online:**

Graph TC\_0408 (Label): Y-Axis TC\_0408 (Label) showing temperature (°C) vs. time (t). The curve starts at 1.0°C and rises to 100.0°C.

HorizChart (Label): Horizontal bar chart showing values for SourceValue1Blue\_TC\_0140 and Variable4 Float (Label).

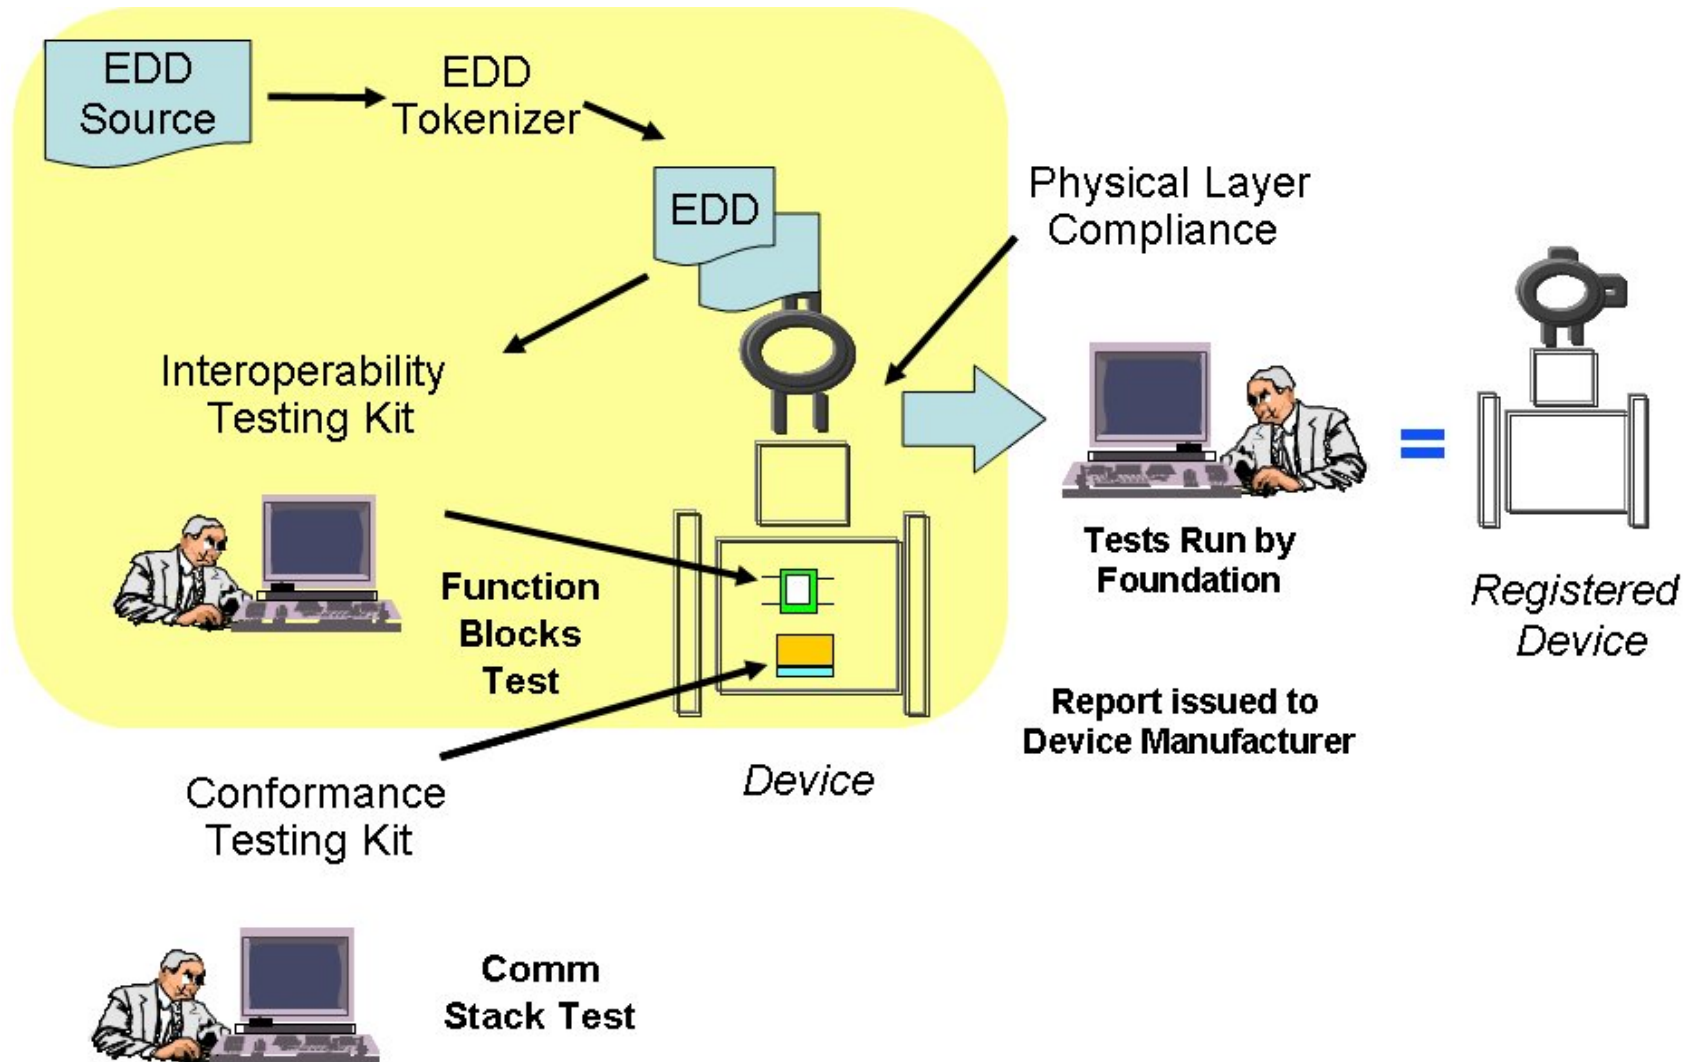

- Text editor with syntax-highlighting and coloring
- Project management
- Integrated method debugger
- Syntax and semantic check supports the three profiles:
  - PROFIBUS
  - HART
  - Fieldbus

# EDD Development Process

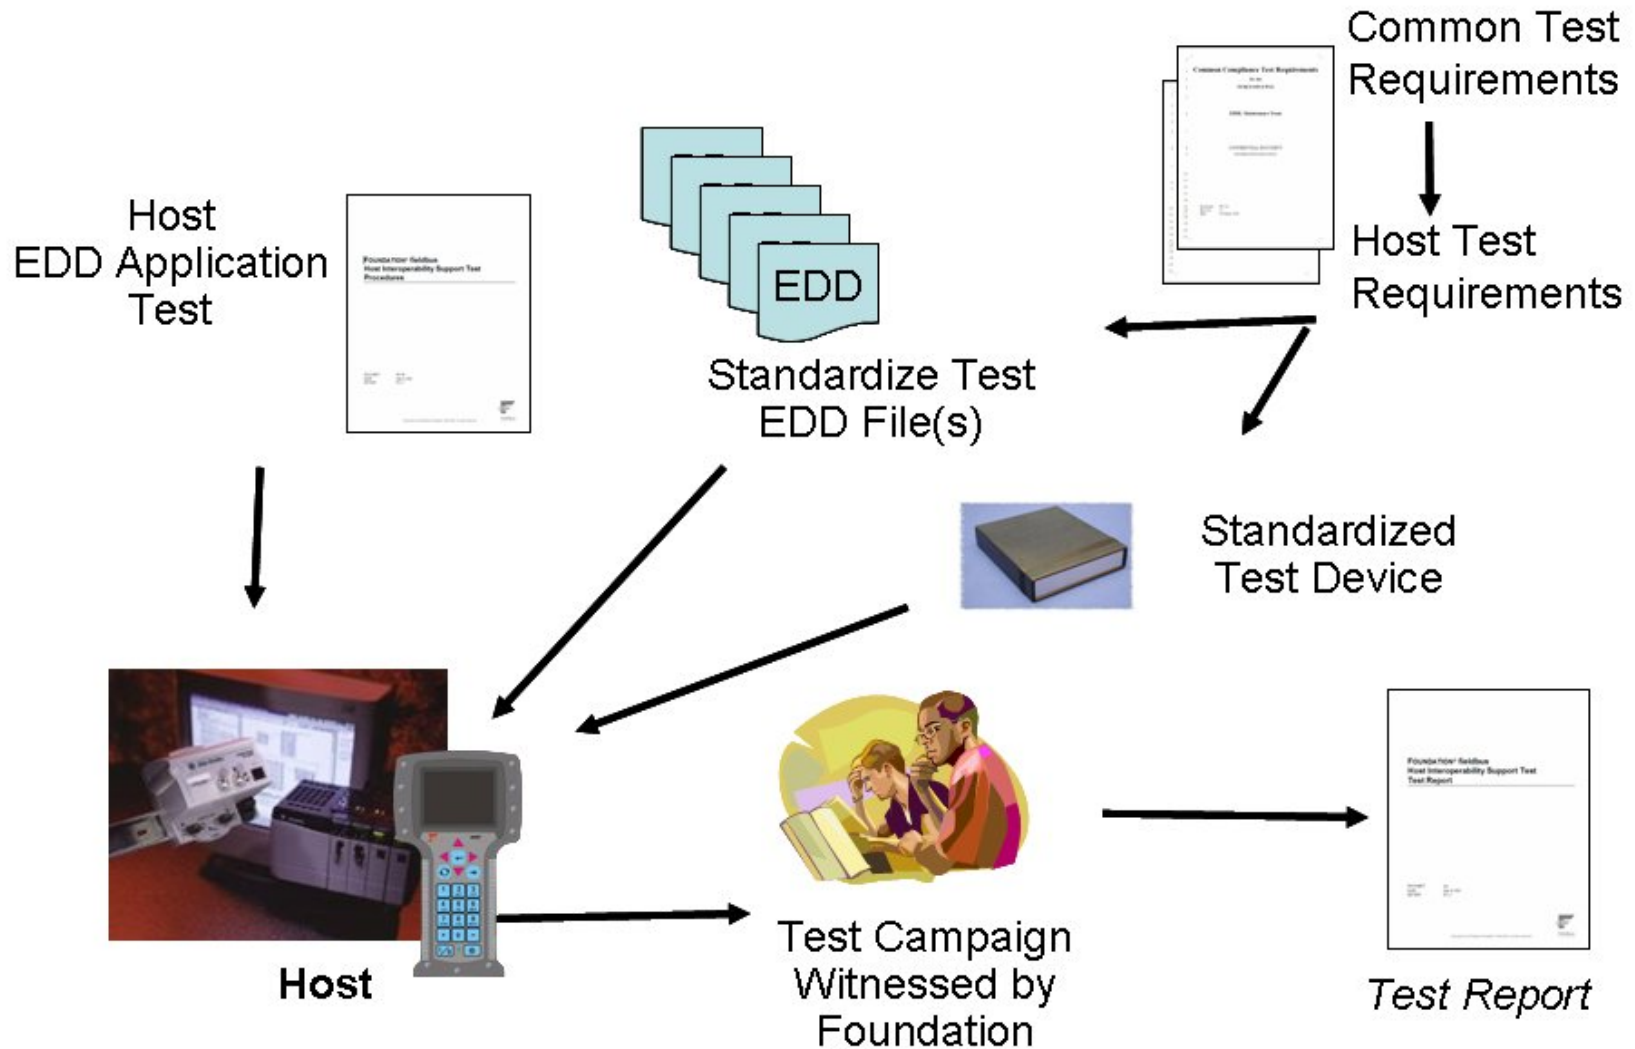

- EDD files created by the device developer are registered together with the device as part of the ***device interoperability registration process.***

# Example – Device Testing and Registration

# Example - Host Interoperability Support Test

- History of Development
- How EDDL Technology Works
- **Benefits of Approach**
- Recent EDDL Advancements – Examples
- Updating Systems And Communicators
- Demonstration.

- Provides a well-defined structure
- Support the most simple to the very complex field device.
- Since EDD's are text-based, these files are independent of operating systems and control platforms.
- The same EDD has common look and feel across applications which reduces the learning curve.
- A field device can be incorporated without affecting the runtime stability of the control system.

EDDL enables interoperability across multiple hosts, devices and technologies.

- EDDL / EDDs are Independent from:
  - Operating systems and versions
  - DCS Platforms
  - Communication and interface paths
- EDDL technology was designed to avoid the need for special, proprietary, and operating system-specific host application files
- It allows a host system to both configure as well as monitor devices on-line

# EDDL: Operating System Independent

- Application on PC or Handheld uses the same EDD
- Fully backward compatible

## EDD's enable :

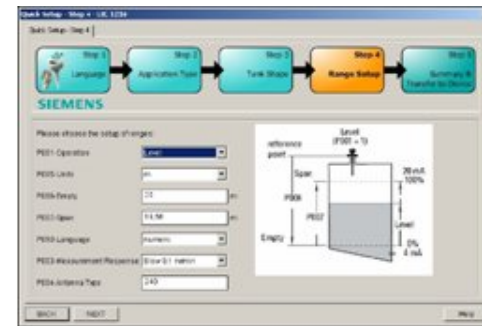

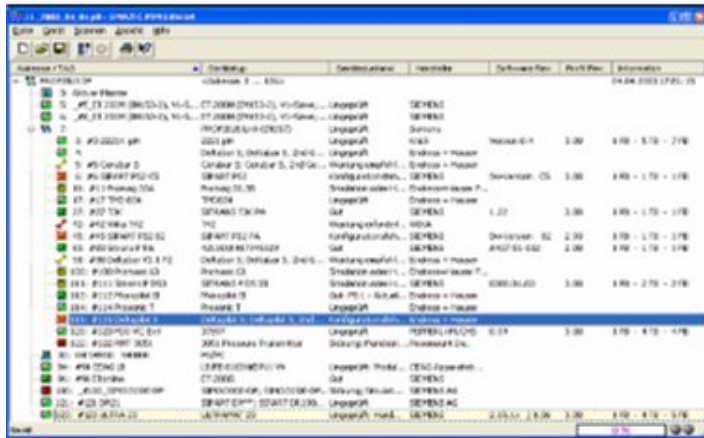

- Devices from different suppliers to interoperate with a single Host
- The same device to interoperate with different Hosts.

Describes

How the device functions per IEC 61804  
Small ASCII files (< 200k)

- One tool for all devices
  - Common transparent data base
  - A new device just a new EDD
- Build in state of the art graphics
  - Trends, Bar graphs

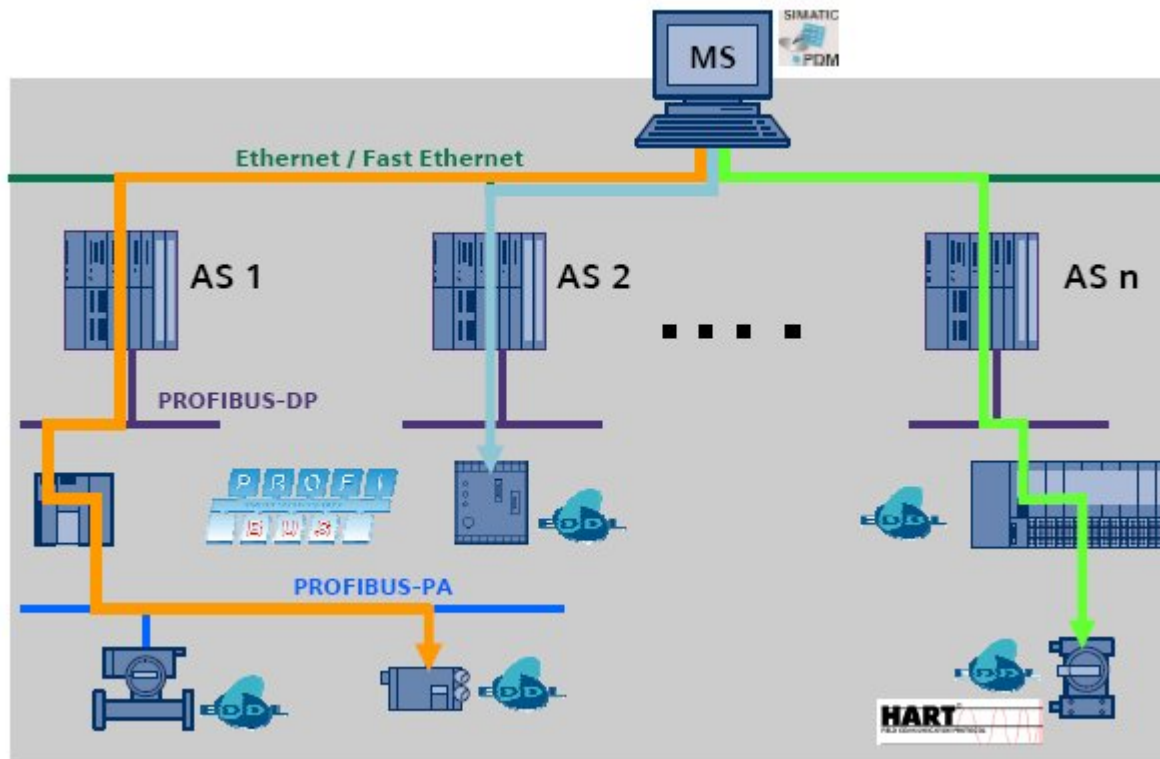

- There is no executable code with EDDs which may have an effect to the stability of the operating system
- EDDs are interpreted and therefore encapsulated
  - No impact of one EDD to others
  - Easy update and device additions during operation

- The EDDL enhancements enable device manufacturers to describe the complete user interface for all device requirements.
- The many support features of EDDL, such as the “Methods” construct, enable automate procedures to ensure set-up, maintenance and diagnostic functions are performed properly.
- EDDL can be used to handle or show field device status via diagnostic parameters e.g. pH sensors are coated.
- The style (look & feel) comes from the host. This ensures that colors are used consistently and that buttons and other controls function uniformly.

# EDDL Benefit – Minimizes Risk

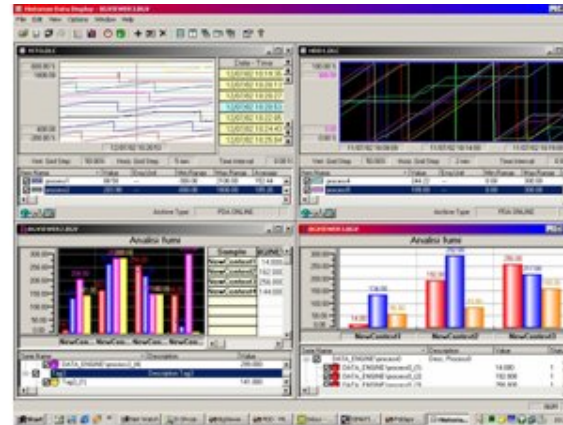

- Prevents Conflicts between different Versions of a device.
- Complies with NAMUR NE 105.
- Quick installation of new devices
- No Special expert knowledge/privilege Required
- No additional Cost for EDD files.
- Multi-lingual support

# EDDL Benefit – Scalable To System

- EDDL is used
  - from Handheld

- to MES<sup>1)</sup>

- from simple devices

- to very complex devices

1) Manufacturing Execution System

# EDDL Advantage Over FDT/DTM

- Taken together, the technology advantages of EDDL provide significant benefits over other approaches such as FDT/DTM in terms of longevity and stability of the instrumentation and control system over the plant lifecycle.
- EDDL is a declarative technology, not a software program like FDT/DTM .
- The EDD file format is readable by many devices including handheld communicators, control systems, PC's and other process interface devices that are DD-enabled.
- EDDL, being text-based, is independent of operating systems and control platforms.
- Through the use of EDDL, it is possible to avoid problems caused by operating system upgrades, control system revisions, and new versions of the device software from multiple suppliers different than that of the host system.

# Installation, Restarts and Downtime

**Restart your PC for each DTM you install**

**InstallShield Wizard Complete**

The InstallShield Wizard has successfully installed [DTM] [FDT]. Before you can use the program, you must restart your computer.

Yes, I want to restart my computer now.

No, I will restart my computer later.

Remove any disks from their drives, and then click Finish to complete setup.

< Back Finish >

**DTM, install each device as a separate program**

**EDDL, load all the files at one time and go.**

**Device Installation**

Device Installation has determined that the devices selected in the tree below do not exist on your system. They will be installed by default.

You may change the installation set by selecting or deselecting as desired. However, devices that are already in your database will not be overwritten.

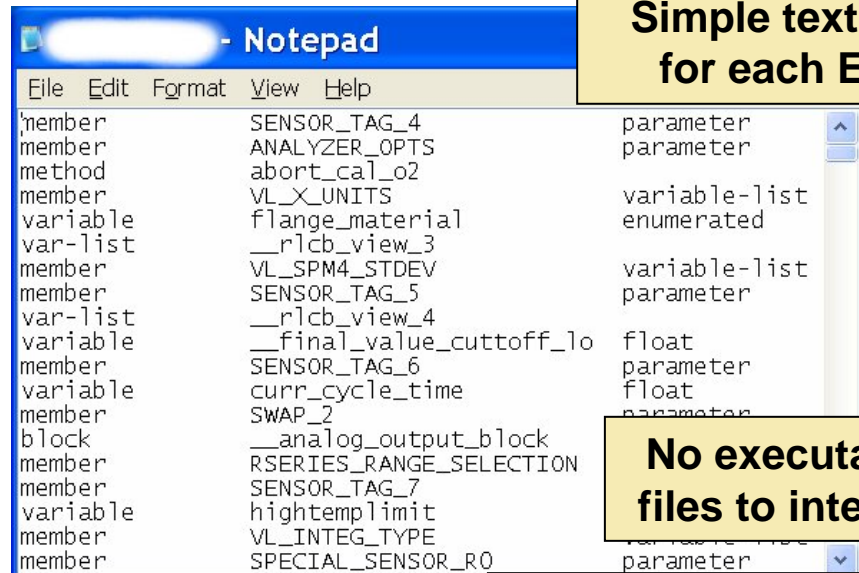

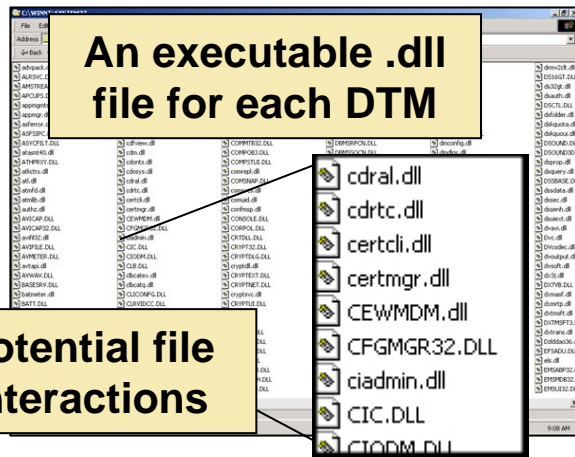

You may rerun the device installation program at any time by double clicking on the "Add Device type" icon.

  - Delete one effect many?
  - Viruses?

- EDDL
  - Simple text file

**No shutdowns and restarts for malware to exploit**

## Prerequisites and Requirements

The DTM (software) requires a frame application conforming to FDT  
The DTM is released to run under the operating systems WINDOWS 2000  
(Service Pack 2) and WINDOWS NT (Service Pack 6).

### OS restrictions

Internet Explorer 6.0 or higher and .Net Framework 1.1 or higher are required to use Version x. We recommend to download the software directly from the Microsoft website.

### Services / Upgrades to download

Prior to installing a device DTM, please note the following:

If a previous version of a device DTM has already been installed, select the "repair" option. Install the device DTM as a basic version. If a professional version is required, please contact the Sales Department of or your local sales representative after having installed the basic version.

The device DTMs can be used both in and in other applications compatible with FDT

**Maintenance procedures and version concerns**

### *Upgrading EDDL*

Upgrade the host application (EG AMS Device Manager) to version that supports the EDDL enhancements (One Time)

Load new EDD files for the desired devices

Use existing DD's and devices without change

**Programs, Databases, etc to add.**

- FDT/DTM

- Operating System Dependent
- Sometimes SP dependent
- May need to change FDT and DTM's with a host upgrade
- Many operating systems are not supported

- EDDL

- Works on most operating systems and service packs
- No DD migration with OS change

- FDT/DTM
  - Focus on device configuration vs. comprehensive asset management
  - No real-time alert monitoring for predictive maintenance
  - No automated configuration of the FDT application
  - No UI consistency
  - No Audit Trail consistency
  - No concurrent access to multiple devices (e.g. Batch Runner functionality)
- EDDL
  - Configuration and asset management
  - Real time alert monitoring
  - Automated configuration of the application (just add the EDD)
  - UI Consistency
  - Audit trail consistency
  - Concurrent access multiple devices

- FDT/DTM
  - Ongoing maintainability
  - No client/server architecture
  - Operating system dependencies
  - Susceptibility to viruses
  - No backward compatibility
  - Does not meet NAMUR requirements
- EDDL
  - No OS specific maintenance
  - No Device rev specific maintenance
  - No program installing and uninstalling
  - Supports client – server
  - Supports non-windows OS's
  - Backward compatible
  - Meets NAMUR requirements

- History of Development
- How EDDL Technology Works
- Benefits of Approach
- **Recent EDDL Advancements – Examples**
- Updating Systems And Communicators
- Demonstration.

- Through the work of the ECT, EDDL enhancements have been developed for the following:
  - Improved data visualization and display capabilities, such as for waveforms and valve signatures
  - A standardized method to access historic measurement or device performance information
  - Enhanced tools for display and use of high-level information such as algorithmic relationships for Complex device parameters.
  - Improved user interface with support for menus (windows, tabs and groups) and added graphic support for graphs, charts and dial indicators.
- These enhancements were submitted to the International Electrotechnical Commission (IEC), and are reflected in IEC 61804-3.

- Identification
- General Information
- Diagnostics
- Performance Analysis
  - For example valve signature, hysteresis, step response etc.
- Operational Statistics
- Parameterization and Range
  - Advanced setup such as radar echo curve
- Simulation and Override
- Calibration Trim
- Monitoring
- Device Security
- Reset

# Example – Host 2 Online - View

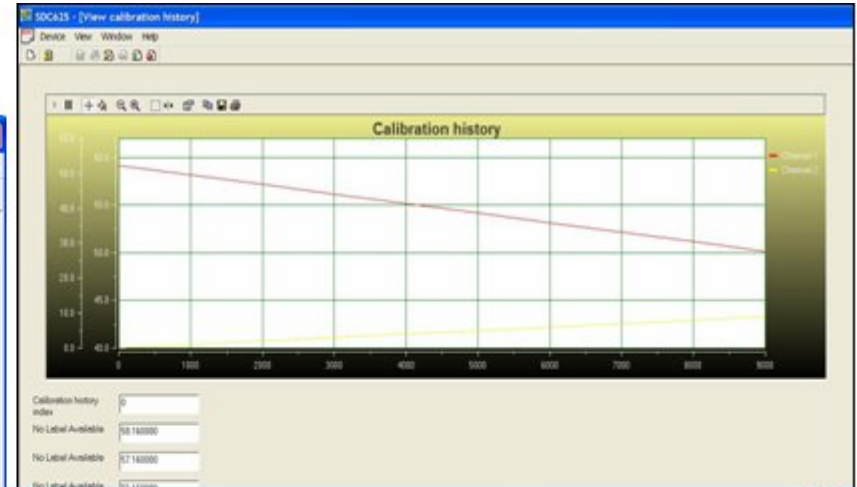

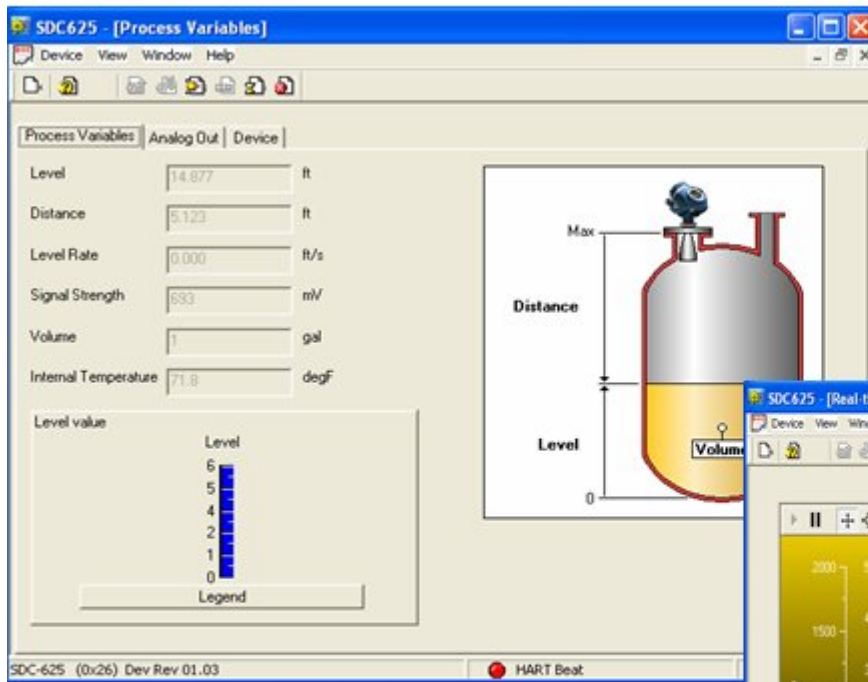

- EDD-based Views
- Central common View (same look and feel for all Devices)
- Contents are defined in the Device description (EDD).

The screenshot displays the SIMATIC Manager interface for a MICROMASTER 440. The main window shows the 'Parameter' tab for the device, with fields for TAG, Tag location, Installation date, Description, Signature, Manufacturer (SIEMENS AG), and Order number (MI FR). Overlaid on this is a 'Display - LIC 2790 [Online]' window showing a pressure value of 0.10389 mbar on a scale from 0 to 1000 mbar. Another window, 'Antriebskonfiguration - MicroMaster 440 [Online]', shows the drive configuration with a diagram of the motor and its electrical connections. A diagnostic window at the bottom left shows a graph of the output frequency, which is currently at -2.490 Hz.

# Example – Host 1 and Handheld

# Host 3 – Example Interface Display

# Example – Pressure Transmitter

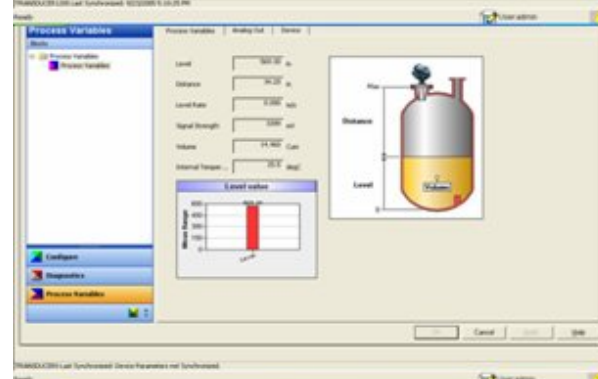

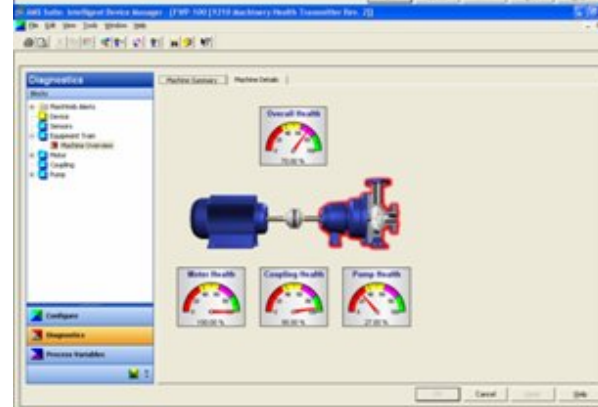

The image displays three overlapping windows from the AMS Suite Intelligent Device Manager software, illustrating the configuration and monitoring of a pressure transmitter.

- Top Left Window (Process Variables):** Shows the configuration for a pressure transmitter. It includes two analog gauges: "Mass Flow" (range 0.00 to 2.0000) and "Differential Pressure" (range 0.00 to 137.0000). The status for both is "Bad\_OutOfService". A "Tag Description" field is also visible.
- Top Right Window (Pressure Status):** Displays the current "Pressure Status" as "GOOD". Below this is a "Pressure" graph showing historical data points over time (from 15:21:51 to 15:35:11). The graph shows a stable pressure level around 250,000 h2O.
- Bottom Window (Device Diagnostics):** Shows the diagnostic configuration for the transmitter. It includes sections for "Plugged Impulse Line Detection" and "Plugged Impulse Line History". The "Plugged Impulse Line" status is currently "Not Licensed". The "Block Mode" is set to "AUTO".

Additional details visible in the windows include the device name "T.Js 30515 v23 [3051 Rev. 23]", the user "User:admin", and the time "1/2/2007 3:06:41 PM".

- The *look and feel* of the User Interface is determined by the Host System
  - All devices on a given Host system will have the same look and feel.
  - Necessary for efficient utilization by operator and maintenance personnel.
  - The same field device will have a different look and feel on each Host system.
- The *detailed information* of the Device is still determined by the Device Manufacturer in the EDD

# EDDL - Consistent Look & Feel for a given Host

# Example: Radar Level EDD on 4 different Hosts

The look and feel of the *User Interface* is determined by the Host System

The detailed information of the *Device* is determined by the EDD

Host	Host 1	Host 2	Host 3	Handheld
Process Variables Trending				
Geometry				
Echo Tuning				

- History of Development
- How EDDL Technology Works
- Benefits of Approach
- Recent EDDL Advancements – Examples
- **Updating Systems And Communicators**
- Demonstration.

- It is common in many plants for both handheld communicators and intelligent device management software in a plant.
- The EDD source file created for an instrument never requiring an upgrade, revision, or patch to work with a new or upgraded control system or handheld.
- However, to take advantage of the latest enhancements that manufactures have implemented in the device EDD, it is best to periodically verify that the latest EDD is being used in device maintenance and support.
- If a manufacturer has introduce a new EDD for a device, then it is a simple matter to incorporate the latest EDD into the control system and handheld.

- New device vendors, models, and versions come to market every week
  - EDDL is a small file
  - Existing device files are pre-loaded on systems
  - Additional files on CD
  - Download new files from Internet without long waits or timeout
  - EDDL can even be stored in device itself
- An EDDL file is easy to add
  - Just copy to hard disk
  - No need to install
  - No need for high-level access privileges
  - No registry entries are done
  - No restart required
  - Other applications are not disturbed
  - No DLL conflicts
  - Device versions are organized

# Accessing the Latest Device EDD

The screenshot shows the Fieldbus Foundation website interface. The main content area is titled 'Product Information' and displays details for a 'Pressure Transmitter'. The details include:

- Category: Pressure
- Revision: 1
- Type: Pressure Transmitter
- Registered Function Blocks: 3xAI(s), 1xPID(s), 1xRB(e)
- Other Blocks: 1xP TB(c), 1xTB(c)
- H1 Profile Class: 31PS, 32L
- H1 Device Class: Link Master
- Test Campaign Number: IT024800
- MANUFAC\_ID (HEX): 534147
- DEV\_TYPE (HEX): 000B
- DEV\_REV (HEX): 01
- Device Tester Version: 1.5.5
- Test Status: Test Failed

A 'File Download' dialog box is open, asking 'Do you want to open or save this file?'. The file details are:

- Name: IT029200.ZIP
- Type: Compressed (zipped) Folder
- From: www.fieldbus.org

Buttons for 'Open', 'Save', and 'Cancel' are visible. A security warning at the bottom states: 'While files from the Internet can be useful, some files can potentially harm your computer. If you do not trust the source, do not open or save this file. [What's the risk?](#)'

Obtain latest version device EDD from:

- Device manufacturer.
- The registered Foundation web site
  - Fieldbus Foundation, HART and Profibus International web sites.
- The control system supplier

- **Demonstration.**

EDDL is ***The*** International standard for Device Description Language

- Robust
- Secure
- Externally accessible information
- Single universal solution
- Investment protection
- Consistent display of devices
- No version conflicts
- Cross-platform compatibility
- Easy integration and removal
- No licensing
- Full support of device functionality
- Certification
