Chapter 5

Hypermedia Document Management: A Metadata and Meta-Information System

Woojong Suh & Heeseok Lee
Korea Advanced Institute of Science and Technology, Korea

Recently, many organizations have attempted to build hypermedia systems to expand their working areas into Internet-based virtual workplaces. Thus, it is important to manage corporate hypermedia documents effectively. Metadata plays a critical role for managing these documents. This paper identifies metadata roles and components to build a metadata schema. Furthermore, a meta-information system, HyDoMiS (Hyperdocument Meta-information System) is proposed by the use of this metadata schema. HyDoMiS performs three functions: metadata management, search, and reporting. The metadata management function is concerned with workflow, documents, and databases. The system is more likely to help implement and maintain hypermedia information systems effectively.

INTRODUCTION

Today, hypermedia documents are growing explosively in many organizations because of the large number of attempts to develop systems employing intranets or extranets for electronic commerce (EC). These systems include hypermedia documents (hyperdocuments) for supporting organizational tasks. Hyperdocuments employed for such tasks are referred to as organizational hyperdocuments (OHDs). They typically play a critical role in...
business, in the form of, for example, invoices, checks, or orders. The 
maintenance of OHD is becoming a burdensome task; managing their needs 
is as important to economic success as is software maintenance (Brereton et 
al., 1998). A hypermedia document—a special type of digital document—is 
based on the inter-linking of nodes, such as multimedia components, etc. 
(Nielsen, 1993); i.e., it is an application of hypertext technologies employing 
multimedia components (Fluckiger, 1995). In contrast to other digital docu-
ments, a hyperdocument has links to various nodes, “hyperlinks,” which are 
used as a path for the navigation.

Most of the previous studies on metadata for digital documents have 
investigated the topic from a technical perspective, such as information 
discovery. However, corporate digital documents are closely related to 
business tasks in an organization. In this context, OHDs typically have 
complex relationships with both information and business processes. The 
OHDs can impact the speed of communications and the productivity of 
business processes. Accordingly, OHDs should be designed to support 
collaboration among workers in business processes. This aspect needs to be 
considered in defining metadata of the OHDs for their effective management. 
Furthermore, such documents should also be considered from a technical 
aspect. The system resources used by OHDs are a considerable part of the 
organizational assets.

The two objectives of this paper are (i) to propose metadata classification 
and metadata schema for OHDs, and (ii) to implement a meta-information 
system on the basis of the schema. The system was designed to support the 
maintenance of OHDs. Our research is rooted in previous studies on the 
various types of multimedia documents so as to capture the more generic 
perspective of metadata.

METADATA AND META-INFORMATION SYSTEM

Metadata is generally known as data about data (or information about 
information). Metadata for digital documents has been explored from various 
research perspectives: mixed media (Chen et al., 1994), multimedia represen-
tations (Kashyap & Seth, 1996), document objects (Sutton, 1996), and 
networked information resources (Dempsey & Weibel, 1996). Much past 
research has concentrated on the use of metadata to support access to media-
and application-specific documents. This metadata describes various system 
properties, such as video (Jain & Hampapur, 1994), images (Anderson & 
Stonebraker, 1994; Kiyokawa et al., 1994), or speech and text document 
(Glavitsch et al., 1994). In contrast to these, it has been suggested that media-
integrated metadata should be developed for the management of documents
