Received 21 May 2010; accepted 26 June 2010

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.044; wR factor = 0.094; data-to-parameter ratio = 12.6.

The reaction of 2-(aminomethyl)pyridine and 4-toluene-sulfonyl chloride in CH_2Cl_2 at pH 8 led to the title compound, $\text{C}_{20}\text{H}_{20}\text{N}_2\text{O}_4\text{S}_2$. The aromatic rings are almost perpendicular to each other and the dihedral angles between the aromatic ring planes are 74.33 (9) (central pyridine *versus* benzene ring of the tosyl group bonded to the imine functionality), 73.77 (6) (pyridine *versus* benzene ring of the tosyl group bonded to pyridinic N atom) and 79.83 (9)° (benzene rings of tosyl groups). In the crystal structure, intermolecular aromatic π - π stacking interactions [centroid-centroid separation = 3.6274 (14) Å] help to consolidate the packing.

4-Methyl-*N*-[(*E*)-4-methyl-1-(4-methylphenylsulfonyl)-1,2-dihydropyridin-2-ylidene]benzenesulfonamide

Masoumeh Tabatabaee, Mitra Ghassemzadeh, Liela Hesami and Bernhard Neumüller

S1. Comment

The sulfonamides represent an important class of biologically active compounds (Supuran *et al.*, 1999). There are several sulfonamide-based groups of drugs. Aromatic sulfonamides are strong inhibitors of carbonic anhydrase (Maren, 1967) and are of pharmacological value because of their effects on various physiological reactions ultimately involving bicarbonate. Some 10,000 structurally different sulfonamides have been synthesized as a result of the discovery of the antibacterial properties of sulfanilamide. The practice of synthesizing numerous structurally related compounds in an effort to find some that are more efficient or have fewer side effects than those already available is very important for the pharmaceutical industry. Moreover, sulfonamides containing different donor atoms find use in coordination chemistry. Recently, synthesis and crystal structure of several sulfonamide ligands with heterocyclic amines and their complexes have been reported (Culf *et al.*, 1997; Kremer *et al.*, 2006; Beloso *et al.*, 2003, 2004, 2005, 2006). In continuation of our recent work on synthesis of new ligands with S and N donor atoms (Tabatabaee *et al.*, 2006, 2007, 2008, 2009), in this paper we wish to report our results on the synthesis and crystal structure of a bisulfonamide compound, which resulted from 2-amino-4-methylpyridine and 4-toluenesulfonyl chloride. Reaction of one molecule of 4-toluenesulfonyl chloride with the NH₂ group of 2-amino-4-methylpyridine led to corresponding sulfonamide. The resulting sulfonamide shows imido-amido tautomerism. Imido-amido tautomerism has been reported for some sulfonamide compounds (Beloso *et al.*, 2003, 2004, 2005). Reaction of another molecule of 4-toluenesulfonyl chloride with endocyclic NH group in imido form led to the title molecule.

In the molecule (Fig. 1), the bond lengths and angles are unexceptional. The molecule crystallizes in the orthorhombic system, space group *Pbca*. The basic six-membered ring skeletons are planar. *A*: C1/C2/C3/C4/C5/N2; *B*: C10...C15; *C*: C17...C22. The dihedral angles formed by the planes *A* and *B*, *A* and *C*, and *B* and *C*: are 74.33 (9), 73.77 (6), and 79.83 (9)%, respectively, indicating that aromatic rings are almost perpendicular to each other.

Figure 2 shows aromatic π - π stacking interactions between 6-membered rings with separation 3.6274 (14) for *Cg1*...*Cg3* (*Cg1*: ring A, *Cg3*: ring C).

S2. Experimental

2-amino-4-picoline (5 mmol) was added to a solution of 4-toluenesulfonyl chloride (10 mmol) in CH₂Cl₂ (30 ml). The pH of the resulting mixture was adjusted to 8 with an aqueous solution of sodium carbonate. The reaction mixture was stirred at room temperature. The progress of the reaction was monitored by thin layer chromatography (TLC), using ethyl acetate and *n*-hexane in 2:1 ratio as eluent. After completion of the reaction (12 h), water and ethyl acetate (50 ml 1:1) was added and the organic layer was separated. The solvent was evaporated and the solid residue was filtered, washed with cold CH₂Cl₂ (10 ml) and recrystallized from CH₂Cl₂.

S3. Refinement

All H atoms were detected in a difference map. Aromatic H atoms were refined freely, while methyl H atoms were idealized and refined as riding to their parent atom, with calculated isotropic displacement parameters.

Figure 1

The general view of the title compound. Non-H atoms are represented with thermal ellipsoids ($p = 50\%$).

Figure 2
