# All of Statistics: A Concise Course in Statistical Inference 

By Larry Wasserman

Chapter 1 \& 2 Overview Presentation

Toby Xu UW Madison

05/29/07

## Chapter 1 Overview

- Sample Space
- Disjoint or Mutually Exclusive
- Probability Axioms/Basic Properties
- Finite sample spaces
- Independent Events
- Conditional Probability
- Baye's Theorem

## Sample Space

- Sample Space $\Omega$ is the set of possible outcomes.
- Ex: Toss fair coin twice $\Omega=\{\mathrm{HH}, \mathrm{HT}, \mathrm{TH}, \mathrm{TT}\}$
- Points $\omega$ in $\Omega$ are called sample outcomes, realizations, elements.
- Subsets of $\Omega$ are called events.
- Ex: Event that first toss is head is $A=\{H H, H T\}$
- $A^{c}=$ complement of $A$ (or NOT A)
- $\varnothing=$ complement of $\Omega$

$$
\begin{aligned}
& A \bigcup B=\{\omega \in \Omega: \omega \in A \text { or } \omega \in B \text { or } \omega \in \text { both }\} \\
& A \bigcap B=\{\omega \in \Omega: \omega \in A \text { and } \omega \in B\}
\end{aligned}
$$

## Disjoint or Mutually Exclusive

- Two events (A and B) are mutually exclusive iff $A \bigcap B=\varnothing$
$E x: A_{1}=[0,1), A_{2}=[1,2), A_{3}=[2,3)$
- A Partition of $\Omega$ is a sequence of disjoint sets
- Indicator function of $A$
- Monotone increasing if $A_{1} \subset A_{2} \subset A_{3} \ldots$
- Monotone decreasing if $A_{1} \supset A_{2} \supset A_{3} \ldots$

## Intro to Probability

- $P(A)=$ Probability Distribution or Probability Measure
- Axioms:
- 1) $P(A) \geq 0$ for every $A$
- 2) $P(\Omega)=1$
- If $\mathrm{A}_{1}, \mathrm{~A}_{2} \ldots$ are disjoint then

$$
P\left(\bigcup_{i=1}^{\infty} A_{i}\right)=\sum_{i=1}^{\infty} P\left(A_{i}\right)
$$

- Statistical Interference:
- Frequentist
- Bayesian Schools

## Basic Properties of Probability

$$
\begin{aligned}
& P(\varnothing)=0 \\
& A \subset B \Rightarrow P(A) \leq P(B) \\
& 0 \leq P(A) \leq 1 \\
& A \bigcap B=\varnothing \Rightarrow P(A \bigcup B)=P(A)+P(B) \quad \text { For Disjoint Probabilities only } \\
& \mathrm{P}\left(\mathrm{~A}^{\mathrm{c}}\right)=1-\mathrm{P}(\mathrm{~A}) \\
& P(A \bigcup B)=P(A)+P(B)-P(A B) \\
& \mathrm{A} \text { or } \mathrm{B}=(\mathrm{AB}) \text { or }(\mathrm{AB}) \text { or }(\mathrm{A} \mathrm{~B})
\end{aligned}
$$

## Probability on Finite Sample Spaces

- $P(A)=A / \Omega$

$$
\binom{n}{k}=\frac{n!}{k!(n-k)!} \quad \text { N choose } \mathrm{k}
$$

$$
\begin{aligned}
& \binom{n}{0}=\binom{n}{n}=1 \\
& \binom{n}{k}=\binom{n}{n-k}
\end{aligned}
$$

- $N$ choose $K$ is counting how many ways can we get a $k$-subset out from a set with $n$ elements.
-Ex: There's 10 people in the Book Club; We want groups of 2 people. How many possible combinations?

$$
\binom{10}{2}=\frac{10!}{2!(10-2)!}=45
$$

## Independent Events

- Two events are independent (does not directly affect the probability of the other from happening) iff: $P(A B)=P(A) P(B)$
- A set of events $\left\{A_{i}: i \varepsilon\right.$ $\}$ is independent if

$$
P\left(\bigcap_{i \in J} A_{i}\right)=\prod_{i \in J} P\left(A_{i}\right)
$$

- Assume A \& B are disjoint events, each with +ve probability. Can they be independent?

Ans: No because: Independent $=P(A B)=P(A) P(B)$ But here $P(A B)=\varphi=0$ and $P(A) P(B)>0$
-Independence is sometimes assumed \& sometimes derived.

$$
\begin{aligned}
& \text { Ex: Toss a fair die } A=\{2,4,6\} B\{1,2,3,4\} \text { } A \bigcap B=\{2,4\} \\
& P(\Delta R)=2 / 6=P(\Delta) P(R)=1 / 2 *) / 3
\end{aligned}
$$

$$
P(A B)=2 / 6=P(A) P(B)=1 / 2 * 2 / 3
$$

## Conditional Probability

- Assuming $\mathrm{P}(\mathrm{B})>0 \ldots \mathrm{P}(\mathrm{A} \mid \mathrm{B})=\mathrm{P}(\mathrm{AB}) / \mathrm{P}(\mathrm{B})$
- If $A \& B$ are independent then $P(A \mid B)=P(A)$
- Ex: Draw Ace of clubs (A) and then Queen of Diamonds (B) $P(A B)=P(A) P(B \mid A)=1 / 52^{*} 1 / 51=1 / 2652$
- $P(. \mid B)$ satisfies the axioms, for fixed $B$
- $P(A \mid$.$) does not satisfy the axioms of probability, for fixed A$
- In general $P(A \mid B) \neq P(B \mid A)$

## Bayes' Theorem

- The Law of Total Probability

$$
P(B)=\sum_{i=1}^{k} P\left(B \mid A_{i}\right) P\left(A_{i}\right)
$$

- $\mathrm{A}_{1} \ldots \mathrm{~A}_{k}$ are partitions of $P(B)=\sum P\left(C_{i}\right)=\sum P\left(B A_{j}\right)=\sum P\left(B \mid A_{j}\right) P\left(A_{j}\right)$ Where $\mathrm{C}_{\mathrm{j}}=\mathrm{BA}_{\mathrm{j}} \mathrm{C}_{1 \ldots \mathrm{k}}$ are disjoint
- Let $A_{1}, \ldots, A_{k}$ be a partition of $\Omega$ such that $P\left(A_{i}\right)>0$ for each i. If $\mathrm{P}(\mathrm{B})>0$ then, for each $\mathrm{i}=1, \ldots, \mathrm{k}$

$$
P\left(A_{i} / B\right)=\frac{P\left(B \mid A_{i}\right) P\left(A_{i}\right)}{\sum P\left(B \mid A_{j}\right) P\left(A_{j}\right)}
$$

## Additional Examples

- Disease Test with + or - outcomes

Go to test and get + results. What's the probability of one having disease? Ans: not

|  | D | $\mathrm{D}^{\mathrm{c}}$ |
| :--- | :--- | :--- |
| + | .009 | .099 |
| - | .001 | .891 | $90 \% \ldots$ actually $8 P(D \mid+)=\frac{P(+\bigcap D)}{P(+)}=\frac{.009}{.009+.099} \approx 0.08$

- 3 Catergories of Email: $A_{1}=$ "spam", $A_{2}=$ "low priority", $\mathrm{A}_{3}=$ "high priority"
- $P\left(A_{1}\right)=.7, P\left(A_{2}\right)=.2, P\left(A_{3}\right)=.1$ Let $B$ be event that email contains the word "Free"
- $\mathrm{P}\left(\mathrm{B} \mid \mathrm{A}_{1}\right)=.9, \mathrm{P}\left(\mathrm{B} \mid \mathrm{A}_{2}\right)=.01, \mathrm{P}\left(\mathrm{B} \mid \mathrm{A}_{3}\right)=.01$
- Q : receive an email with word "free", what's the probability that it is spam?

$$
P\left(A_{1} \mid B\right)=\frac{.9 \times .7}{(.9 \times .7)+(.01 \times .2)+(.01 \times .1)}=.995
$$

## Chapter 2 Overview

- Random Variable
- Cumulative Distribution Function (CDF)
- Discrete Vs. Continuous probability functions (Probability Density Function PDF)
- Discrete: Point Mass, Discrete Uniform, Bernoulli, Binomial, Geometric, Poisson

Distribution

- Continuous: Uniform, Normal (Gaussian), Exponential, Gamma, Beta, t and Cauchy, $X^{2}$
- Bivariate Distribution
- Marginal Distribution
- Independent Random Variables
- Conditional Distribution
- Multivariate Distributions: Multinomial, Multivariate Normal
- Transformations of Random Variables.

## Random Variable

- A random variable is a mapping
- $\mathrm{X}: \Omega \quad \mathrm{R}$
- That assigns a real number $X(\omega)$ to each outcome $\omega$
- Ex: Flip coin twice and let $X$ be number of heads.

| $\omega$ | $P(\omega)$ | $X(\omega)$ |
| :--- | :--- | :--- |
| TT | $1 / 4$ | 0 |
| TH | $1 / 4$ | 1 |
| HT | $1 / 4$ | 1 |
| HH | $1 / 4$ | 2 |

| $x$ | $P(X=x)$ |
| :--- | :--- |
| 0 | $1 / 4$ |
| 1 | $1 / 2$ |
| 2 | $1 / 4$ |

## Cumulative Distribution Function

- $C D F=F_{X}: R \rightarrow[0,1]$
- $F_{X}(x)=P(X \leq x)$
- Ex: Flip a fair coin twice and let $X$ be number of heads

$$
F_{x}(x)= \begin{cases}0 & \mathrm{x}<0 \\ 1 / 4 & 0 \leq \mathrm{x}<1 \\ 3 / 4 & 1 \leq \mathrm{x}<2 \\ 1 & \mathrm{x} \geq 2\end{cases}
$$

- Theorem: let X and Y have CDF $F$ and $G$. If $F(x)=G(x)$ for all $x$, then $P(X \in A)=P(Y \in$ A)
- Theorem: CDF needs to satisfy:
- F is non-decreasing: $\mathrm{x}_{1}<\mathrm{x}_{2}$, also $F\left(\mathrm{x}_{1}\right) \leq \mathrm{F}\left(\mathrm{x}_{2}\right)$
- F is normalized:
$\lim _{x \rightarrow-\infty} F(x)=0$
$\lim _{x \rightarrow+\infty} F(x)=1$
- $F$ is right-continuous:
$F(x)=F\left(x^{+}\right)$for all, where $\mathrm{F}\left(\mathrm{x}^{+}\right)=\lim _{\substack{y \rightarrow x \\ y>x}} F(y)$

## Discrete Vs. Continuous Distributions

- Def: X is discrete if it take countably many values. We define the probability function or probability mass function for $X$ by $f_{X}(x)=P(X=x)$
- Def: $X$ is continuous if there exists a function $f_{X}$ such that $f_{X}(x) \geq 0$ for all $\mathrm{x},{ }^{+\infty}$ and for every $\mathrm{a} \leq \mathrm{b}$
$P(a<X<b)=\int_{a}^{b} f(x) d x$
- The function $\mathrm{f}_{\mathrm{x}}$ is called the probability density function (PDF).

$$
F_{x}(x)=\int_{-\infty}^{x} f x(t) d t
$$

and $f_{x}(x)=F_{x}^{\prime}(x)$ at all points $x$ at which $F_{x}$ is differentiable Note: mention Lemmas (pg 25)

## Some Important Discrete Functions

- Point Mass Distribution: if $P(X=a)=1$ otherwise 0
- Discrete Uniform
- $\mathrm{f}(\mathrm{x})= \begin{cases}\frac{1}{k} & \text { for } \mathrm{x}=1, \ldots, \mathrm{k} \\ 0 & \text { otherwise }\end{cases}$
- Bernoulli (Binary Coin Flip)
- $f(x)=P^{x}(1-p)^{1-x}$ for $x \varepsilon\{0,1\}$
- Binomial (flip coins $n$ time and let $X$ be number of heads)
$\mathrm{f}(\mathrm{X})=\mathrm{P}(\mathrm{X}=\mathrm{x})=\left\{\binom{n}{x}^{\rho \wedge x(1-p)^{\wedge}(n-x)}\right.$
$\{0$
otherwise
- Geometric $p \varepsilon(0,1)$ (Think $X$ as the No. of flips needed to get the $1^{\text {st }}$ head) - $P(X=k)=p(1-P)^{k-1}, k=1,2,3, \ldots$
- Poisson (Counting rare events like radioactive decay or traffic accidents) $f(x)^{\ominus}=e^{\wedge}(-\lambda) \frac{\lambda^{\wedge} x}{x!}$

## Some Important Continuous Distributions

- Uniform Distribution
- $f(x)=\{1 /(b-a) \quad$ for $x \in[a, b]$
\{0 otherwise
- Normal (Gaussian)

$$
f(x)=\frac{1}{\sigma \sqrt{2 \pi}} \exp \left\{-\frac{1}{2 \sigma^{\wedge} 2}(x-\mu)^{\wedge} 2\right\}
$$

Standard Normal if $\mu=0$ and $\sigma=1$
if $X \sim N\left(\mu, \sigma^{2}\right)$, then $Z=(X-\mu) / \sigma N(0,1)$

- Exponential (Model lifetimes of electronic components/ waiting times between rare events)

$$
f(x)=\frac{1}{\beta} e^{\wedge}(-x / \beta), x>0
$$

- $\quad \mathrm{d}$ distribution is like Normal except with thinker tails
- Cauchy is special case of $t$ distribution where $v=1$
- $X^{2}$ distribution deals with various degrees of freedom

## Bivariate Distribution

- Discrete random variables $X \& Y$, define joint mass function by $f(x, y)=P(X=x$ and $Y=y$ )
- $F(1,1)=P(X=1, Y=1)=4 / 9$
- In continuous case, we use $f(x, y)$ a PDF for the random

|  | $\mathrm{Y}=0$ | $\mathrm{Y}=1$ |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{X}=0$ | $1 / 9$ | $2 / 9$ | $1 / 3$ |
| $\mathrm{X}=1$ | $2 / 9$ | $4 / 9$ | $2 / 3$ |
|  | $1 / 3$ | $2 / 3$ | 1 | variables (X,Y)

- (i) $f(x, y) \geq 0$ for all ( $x, y$ )
- (ii) $\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) d x d y=1$ and,
- for any set A is $\mathrm{RXR}, \mathrm{P}((\mathrm{X}, \mathrm{Y})$

$$
\mathrm{A})=\iint f(x, y) d x d y
$$

## Marginal Distributions

- Def: if $(X, Y)$ have joint distribution with mass function $f_{X, Y}$, then the marginal mass function for X is defined by

$$
f_{X}(x)=P(X=x)=\sum_{y} P(X=x, Y=y)=\sum_{y} f(x, y)
$$

- And the marginal Mass Function for Y is defined by

$$
f_{v}(x)=P(X=x)=\sum_{x} P(X=x, Y=y)=\sum_{x} f(x, y)
$$

- $f_{x}(0)=3 / 10$ and $f_{x}(1)=7 / 10$
- For continuous random variables, the marginal densities are

$$
\begin{aligned}
& f_{X}(x)=\int f(x, y) d y \\
& f_{Y}(y)=\int f(x, y) d x
\end{aligned}
$$

|  | $\mathrm{Y}=0$ | $\mathrm{Y}=1$ |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{X}=0$ | $1 / 10$ | $2 / 10$ | $3 / 10$ |
| $\mathrm{X}=1$ | $3 / 10$ | $4 / 10$ | $7 / 10$ |
|  | $4 / 10$ | $6 / 10$ |  |

## Independent Random Variables

- Def: Two random variables X \& $Y$ are independent iff, for every A \& B,

| $P(X \in A, Y \in B)=P(X \in A) P(Y \in B)$ |  |  |  |
| :--- | :--- | :--- | :--- |
|  $\mathrm{Y}=0$ $\mathrm{Y}=1$ <br> $\mathrm{X}=0$ $1 / 4$ $1 / 4$ <br> $\mathrm{X}=1$ $1 / 4$ $1 / 4$ <br>  $1 / 2$ $1 / 2$ |  |  |  |

- $f_{X}(0) f_{Y}(0)=f(0,0)$
- $f_{X}(0) f_{Y}(1)=f(0,1)$
- $f_{X}(1) f_{Y}(0)=f(1,0)$
- $f_{X}(1) f_{Y}(1)=f(1,1)$

|  | $Y=0$ | $Y=1$ |  |
| :--- | :--- | :--- | :--- |
| $X=0$ | $1 / 2$ | 0 | $1 / 2$ |
| $X=1$ | 0 | $1 / 2$ | $1 / 2$ |
|  | $1 / 2$ | $1 / 2$ | 1 |

- These are not independent because
- $f_{X}(0) f_{Y}(1)=(1 / 2)(1 / 2)=1 / 4$ yet $f(0,1)=0$

## Conditional Distributions

- Def:
- $f(x \mid y)=P(X=x \mid Y=y)=P(X=x, Y=y) / P(Y=y)=f(x, y) / f(y)$
- Assuming that $\mathrm{f}(\mathrm{y})>0$
- Def: for continuous random variables,
- $f(x \mid y)=f(x, y) f(y)$
- Assuming that $\mathrm{f}(\mathrm{y})>0$. Then,

$$
P(X \in A / Y=y)=\int_{A} f(x \mid y) d x
$$

## Multivariate Distribution and IID Samples

- If $\mathrm{X}_{1}, \ldots, \mathrm{X}_{\mathrm{n}}$ are independent and each has the same marginal distribution with CDF $F$, we say that $X_{1}, \ldots, X_{n}$ are independent and identically distributed and we write
- $X_{1}, \ldots X_{n} \sim F$
- Random sample size n from F

## 2 Important Multivariable Distributions

- Multinomial: multivariate version of a Binomial
- $\quad$ X ~Multinomial(n,p)

$$
f(x)=\binom{n}{x 1 \ldots x k} P 1^{\wedge}(x 1) \ldots P k^{\wedge}(x k)
$$

Where

$$
\binom{n}{x 1 \ldots x k}=\frac{n!}{x 1!\ldots x k!}
$$

- Multivariate Normal: $\mu$ is a vector and $\sigma$ is a matrix ( pg 40 )

## Transformations of Random Variables

- Three steps for Transformations
- 1. For each $y$, find the set $A_{y}=\{x: r(x) \leq y)$
- 2.Find CDF
- $F(y)=P(Y \leq y)=P(r(X) \leq y)$
$=P(\{x ; r(x) \leq y\})$
$=\quad \int_{A y} f x(x) d x$
- 3. The PDF is $f(y)=F^{\prime}(y)$
