Interval Valued Neutrosophic Parameterized Soft Set
Theory and its Decision Making

Said Broumi
Irfan Deli
Florentin Smarandache

Abstract – In this work, we present definition of interval valued neutrosophic parameterized (IVNP-)soft set and its operations. Then we define parameter reduction method for IVNP-soft set. We also give an example which shows that they can be successfully applied to problem that contains indeterminacy.

Keywords –
soft set, neutrosophic set,
neutrosophic soft set.

1. Introduction

In 1999, Smarandache firstly proposed the theory of neutrosophic set (NS) [34], which is the generalization of the classical sets, conventional fuzzy set [40] and intuitionistic fuzzy set [5]. In recent years, neutrosophic sets has been successfully applied to many fields such as: control theory [1], databases [3,4], clustering [36], medical diagnosis problem [2], decision making problem [25,37], topology [26], and so on.

Presently work on the neutrosophic set theory is progressing rapidly such as; Bhowmik and Pal defined intuitionistic neutrosophic set [9] and intuitionistic neutrosophic relations [10]. Later on Salam, Alblowi [33] introduced another concept called generalized neutrosophic set. Wang et al. [38] proposed another extension of neutrosophic set which is single valued neutrosophic. Also Wang et al. [39] introduced the notion of interval valued neutrosophic set which is an instance of neutrosophic set. It is characterized by an interval membership degree, interval indeterminacy degree and interval non-membership degree. Many applications of neutrosophic theory have been worked by Geogiev [23], Ye
In 1999 a Russian researcher [32] firstly gave the soft set theory as a general mathematical tool for dealing with uncertainty and vagueness and how soft set theory is free from the parameterization inadequacy syndrome of fuzzy set theory, rough set theory, probability theory. Then, many interesting results of soft set theory have been studied on fuzzy soft sets [15, 27], on FP-soft sets [20,21], on intuitionistic fuzzy soft set theory [8,17,28], on intuitionistic fuzzy parameterized soft set theory [18], on interval valued intuitionistic fuzzy soft set [24], on generalized fuzzy soft sets [30,35], on generalized intuitionistic fuzzy soft set [6], on possibility intuitionistic fuzzy soft set [7], on intuitionistic neutrosophic soft set [11], on generalized neutrosophic soft set [12], on fuzzy parameterized fuzzy soft set theory [16], on IFP-fuzzy soft set theory [19], on neutrosophic soft set [29]. Recently, Deli [22] introduced the concept of interval valued neutrosophic soft set as a combination of interval neutrosophic set and soft sets.

In this paper our main objective is to introduce the notion of interval valued neutrosophic parameterized soft set which is a generalization of neutrosophic parameterized soft sets [13]. The paper is structured as follows. In Section 2, we first recall the necessary background on neutrosophic sets, interval neutrosophic sets and soft sets. In Section 3, we present interval valued neutrosophic parameterized soft set theory and examines their respective properties. In section 4, we present a interval valued neutrosophic parameterized aggregation operator. Section 5, interval valued neutrosophic parameterized decision methods is presented with example. Finally we conclude the paper.

2. Preliminaries

Throughout this paper, let $U$ be a universal set and $E$ be the set of all possible parameters under consideration with respect to $U$, usually, parameters are attributes, characteristics, or properties of objects in $U$.

We now recall some basic notions of neutrosophic set, interval valued neutrosophic set and soft set. For more details, the reader could refer to [29, 32, 34, 39].

**Definition 2.1.** [34] Let $U$ be a universe of discourse then the neutrosophic set $A$ is an object having the form

$$A = \{ < x: \mu_{A(x)}, \nu_{A(x)}, \omega_{A(x)>}, x \in U \}$$

where the functions $\mu, \nu, \omega : U \rightarrow [0,1]^+$ define respectively the degree of membership, the degree of indeterminacy, and the degree of non-membership of the element $x \in X$ to the set $A$ with the condition.

$$0 \leq \mu_{A(x)} + \nu_{A(x)} + \omega_{A(x)} \leq 3^+.$$  \hspace{1cm} (1)

From philosophical point of view, the neutrosophic set takes the value from real standard or non-standard subsets of $]-0,1^[+$. So instead of $]0,1^[+$ we need to take the interval $[0,1]$ for technical applications, because $]0,1^[+$ will be difficult to apply in the real applications such
as in scientific and engineering problems.

**Definition 2.2.** [39] Let X be a space of points (objects) with generic elements in X denoted by x. An interval valued neutrosophic set (for short IVNS) A in X is characterized by truth-membership function \( \mu_A(x) \), indeterminacy-membership function \( \nu_A(x) \) and falsity-membership function \( \omega_A(x) \). For each point x in X, we have that \( \mu_A(x), \nu_A(x), \omega_A(x) \in [0,1] \).

For two IVNS

\[
A = \{ <x, [\mu], [\nu], [\omega] > \mid x \in X \}
\]

and

\[
B = \{ <x, [\mu], [\nu], [\omega] > \mid x \in X \}
\]

Then,

1. if and only if

\[
\mu = \mu, \nu = \nu, \omega = \omega
\]

2. 

3. The complement of \( A \) is denoted by \( \overline{A} \) and is defined by

\[
\overline{A} = \{ <x, [\mu], [\nu], [\omega] > \mid x \in X \}
\]

4. \( A \cap B = \{ <x, [\min(\mu), \nu], [\min(\mu), \nu], [\max(\nu), \omega], [\max(\nu), \omega] > \mid x \in X \}
\]

5. \( A \cup B = \{ <x, [\max(\mu), \nu], [\max(\mu), \nu], [\min(\nu), \omega], [\min(\nu), \omega] > \mid x \in X \}
\]

As an illustration, let us consider the following example.

**Example 2.3.** Assume that the universe of discourse U= \( \{x_1, x_2, x_3, x_4\} \). Then, A is an interval valued neutrosophic set (IVNS) of U such that,

\[
A = \{ <x_1, [0.1, 0.8], [0.2, 0.6], [0.8, 0.9] >, < x_2, [0.2, 0.5], [0.3, 0.5], [0.6, 0.8] >, < x_3, [0.5, 0.8], [0.4, 0.5], [0.45, 0.6] >, < x_4, [0.1, 0.4], [0.1, 0.5], [0.4, 0.8] > \}
\]

**Definition 2.4.** [32] Let U be an initial universe set and E be a set of parameters. Let \( P(U) \) denotes the power set of U. Consider a nonempty set A, \( A \subseteq E \). A pair (K, A) is called a soft set over U, where K is a mapping given by \( K: A \rightarrow P(U) \).
As an illustration, let us consider the following example.

**Example 2.5.** Suppose that \( U \) is the set of houses under consideration, say \( U = \{h_1, h_2, \ldots, h_8\} \). Let \( E \) be the set of some attributes of such houses, say \( E = \{e_1, e_2, \ldots, e_4\} \), where \( e_1, e_2, \ldots, e_4 \) stand for the attributes “beautiful”, “costly”, “in the green surroundings”, “moderate”, respectively.

In this case, to define a soft set means to point out expensive houses, moderate houses, and so on. For example, the soft set \((K, A)\) that describes the “attractiveness of the houses” in the opinion of a buyer, says Mr. X, and may be defined like this:

\[
A = E_1, a, (h_1, h_2), (h_3), (h_4, h_5, h_6), (e_4, U).
\]

### 3. Interval Neutrosophic Parameterized Soft Set Theory

In this section, we define interval neutrosophic parameterized soft set and their operations.

**Definition 3.1.** Let \( U \) be an initial universe, \( P(U) \) be the power set of \( U \), \( E \) be a set of all parameters and \( K \) be an interval valued neutrosophic set over \( E \). Then an interval neutrosophic parameterized soft sets (IVNP-soft sets), denoted by \( \Psi_K \), defined as:

\[
\forall \in E \rightarrow [0, 1], \nu_K : E \rightarrow [0, 1], \omega_K : E \rightarrow [0, 1] \text{ and } E \rightarrow P(U) \text{ such that } \Phi \text{ if } .
\]

Here, \( \mu_K, \nu_K \) and \( \omega_K \) called truth-membership function, indeterminacy-membership function and falsity-membership function of (IVNP-soft set), respectively.

**Example 3.2.** Assume that \( U = \{u_1, u_2\} \) is a universal set and \( E = \{x_1, x_2\} \) is a set of parameters. If

\[
K = \{(x_1, [0.2, 0.3], [0.3, 0.5], [0.4, 0.5]), (x_2, [0.3, 0.4], [0.5, 0.6], [0.4, 0.5])\}
\]

and

\[
\forall = \{u_2, u_3\}, f(\forall) = U
\]

then a IVNP-soft set is written by

\[
\forall = \{u_2, u_3\}, f(\forall) = U
\]

**Definition 3.3.** Let \( \in \text{IVNP-soft sets}. \) If \( = \Phi, \) \( = \Phi, \) \( = 0, \) \( = \nu \) and \( \omega_K(x) = \nu \) \( = 1 \forall x \in E \). Then is called empty IVNP-soft set, denoted by .

**Definition 3.4.** Let \( \Psi_K \in \text{IVNP-soft sets}. \) If \( = U, = \mu, = 0, = \nu \) and \( = \omega_K(x) = 1 \forall x \in E \). Then is called K-universal IVNP-soft set, denoted by \( \Psi_K \). If \( K = E \), then the K-universal IVNP-soft set is called universal IVNP-soft set, denoted by \( \Psi_E \).
Definition 3.5. Let and be two IVNP-soft set. Then, $A = \Omega_M$, if and only if $\mu(x), \omega(x)$ for all $x \in E$.

Definition 3.6. Let and be two IVNP-soft set. Then, $A$ is IVNP-subset of $\Omega_M$, denoted by $A \subseteq \Omega_M$, if and only if $\mu(x), \omega(x)$ for all $x \in E$.

Definition 3.7. Let be an IVNP-soft set. Then, the complement of , denoted by , is defined by

$$\bar{A} = \{ (<x, f(x), E) \}
\text{where } f = \text{U}
$$

Definition 3.8. Let and be two IVNP-soft set. Then, union of and , denoted by , is defined by

$$A \cup B = \{ (<x, \max \{\mu_A(x), \mu_B(x)\}, \min \{\omega_A(x), \omega_B(x)\}) \in E \}
\text{where } f = f
$$

Definition 3.9. Let and be two IVNP-soft set. Then, intersection of and , denoted by , is defined by

$$A \cap B = \{ (<x, \min \{\mu_A(x), \mu_B(x)\}, \max \{\omega_A(x), \omega_B(x)\}) \in E \}
\text{where } f = f
$$

Example 3.10. Let $U = \{u_1, u_2, u_3, u_4\}$, $E = \{x_1, x_2, x_3\}$. Then, $\Psi = \{(<x_1, [0.1,0.5],[0.4,0.5],[0.2,0.3]>,\{u_1,u_2\}),<x_2,[0.2,0.3],[0.1,0.3]>,\{u_2,u_3\})\}$

$\Omega = \{(<x_2,[0.1,0.6],[0.2,0.3],[0.4,0.4]>,\{u_3,u_4\}),<x_3,[0.4,0.7],[0.1,0.2],[0.3,0.4]>,\{u_3\})\}$

Then

$$\psi = \{(<x_1,[0.1,0.5],[0.4,0.5],[0.2,0.3]>,\{u_1,u_2\}),(<x,[0.2,0.6],[0.2,0.3]>,\{u_2,u_3\}),(x,[0.1,0.3]>,\{u_2,u_3\})\}
\text{and } \Omega = \{(<x_2,[0.1,0.3],[0.5,0.7],[0.2,0.4]>,\{u_3\})\}
\text{and } \psi = \{(<x_1,[0.2,0.3],[0.4,0.5],[0.1,0.5]>,\{u_3,u_4\}),<x_2,[0.1,0.3],[0.5,0.7],[0.2,0.3]>,\{u_1,u_4\})\}$$
Remark 3.11. $\Psi_K \subseteq \Omega_M$ does not imply that every element of $\Psi_K$ is an element of $\Omega_M$ as in the definition of classical subset. For example assume that $U=\{u_1,u_2,u_3,u_4\}$ is a universal set of objects and $E=\{x_1,x_2,x_3\}$ is a set of all parameters, if IVNP-soft sets $\Psi_K$ and $\Omega_M$ are defined as

$$\Psi = \{(x_1, [0.1,0.3], [0.5,0.5], [0.2,0.3]), (x_2, [0.3,0.4], [0.4,0.5], [0.3,0.5]), (\{u_1, u_2\})\}$$

$$\Omega = \{(x_1, [0.2,0.6], [0.3,0.4], [0.1,0.2]), (x_2, [0.4,0.7], [0.1,0.3], [0.2,0.3]), (\{u_1, u_4\})\}$$

It can be seen that $\Psi \subseteq \Omega$, but every element of $\Psi$ is not an element of $\Omega$.

Proposition 3.12. Let $\Psi_K, \Omega \in \text{IVNP-soft set}$.

i. 
ii. 
iii. 

Proof. It is clear from Definition 3.3-3.5.

Proposition 3.13. Let $\Psi_K, \Omega \in \text{IVNP-soft set}$. Then

i. $\Psi_K = \Psi$ and $\Omega = \Omega$
ii. $\Psi_K = \Psi$ and $\Omega = \Omega$
iii. $\Psi_K = \Psi$ and $\Omega = \Omega$

Proof. It can be proved by Definition 3.3-3.5

Proposition 3.14. Let $\Psi \in \text{IVNP-soft set}$. Then

i. $(\Psi^c)^c = \Psi$
ii. $\Psi = \Psi$
iii. $\Psi = \Psi$

Proposition 3.15. Let $\Psi, \Omega \in \text{IVNP-soft set}$. Then

i. $\Psi = \Psi$
ii. $\Psi = \Psi$
iii. $\Psi = \Psi$
iv. $\Psi = \Omega$
v. $(\Psi) = \Psi \cup (\Omega)$

Proof. It is clear.

Proposition 3.16. Let $\Psi, \Omega \in \text{IVNP-soft set}$, Then

i. $\Psi = \Psi$
ii. $\Psi = \Psi$
iii. $\Psi = \Psi$
iv. $\Omega = \Omega$
v. $(\Psi \cap (\Omega) = \Psi$
Proof. It is clear.

**Proposition 3.17.** Let $\Psi_K, \Omega \in \text{IVNP-soft set}$, then

i. $\cup (\Omega) = (\Psi \cup \Omega) \cap (\Psi_K \cup \Omega_N)$

ii. $\cap (\Omega) = (\Psi \cap \Omega) \cup (\Psi_K \cap \Omega_N)$

Proof. It can be proved by definition 3.8 and 3.9.

**Proposition 3.18.** Let $\Psi_K, \Omega \in \text{IVNP-soft set}$, then

i. $= \Psi$

ii. $= \Psi$

Proof. It is clear.

**Definition 3.19.** Let $\Psi \in \text{IVNP-soft set}$, then

i. OR-product of $\text{ and } \psi$ denoted by $_\text{OR}$, is defined as following

$$(x, y) = \left[ \min \{x, y\}, \max \{\mu_x, \mu_y\} \right],$$

where $(x, y) = (x) (y)$

ii. AND-product of $\text{ and } \psi$ denoted by $_\text{AND}$ is defined as following

$$(x, y) = \left[ \max \{x, y\}, \min \{\mu_x, \mu_y\} \right],$$

where $(x, y) = (x) (y)$

**Proposition 3.20.** Let $\Psi_K, \Omega \in \text{IVNP-soft set}$, then

i. $= \Psi$

ii. $= \Omega$

iii. $= \Omega$

iv. $(\text{OR}) = \Psi \ \text{OR} \ (\Omega)$

v. $(\text{AND}) = \Psi \ \text{AND} \ (\Omega)

Proof. It can be proved by definition 3.15.

### 4. Parameter Reduction Method

In this section, we have defined a parameter reduction method of an IVNP-soft set, that produce a soft set from an IVNP-soft set. For this, we define level set for IVNP-soft set. This concept presents an adjustable approach to IVNP–soft sets based decision making problems.

Throughout this section we will accept that the parameter set $E$ and the initial universe $U$ are finite sets.

**Definition 4.1** Let $\Psi \in \text{IVNPS}$. Then for $a_s = [s^-, s^+]$, $t = [t^-, t^+]$, $q = [q^-, q^+] \subseteq [0, 1]$, the $(s, t, q)$ –level soft set of is a crisp soft set, denoted by $(\Psi_K; (s, t, q))$, defined by
\begin{align*}
(\mu : (s, t, q)) &= \{((x_i, (x_i)) : x_i \in E) \\
) &\text{where} \\
) &s, t, t, \text{and } t, q
\end{align*}

\textbf{Remark} In Definition 4.1, \(s \subseteq [0, 1]\) can be viewed as a given least threshold on degrees of truth-membership, \(t \subseteq [0, 1]\) can be viewed as a given greatest threshold on degrees of indeterminacy-membership. If \(q \subseteq [0, 1]\) can be viewed as a given greatest threshold on degrees of falsity-membership. If \(s^+ \leq \mu^+_k(x_i), t^- \geq \nu^-_k(x_i), t^+ \geq \nu^+_k(x_i)\) and \(q^- \geq \omega^-_k(x_i)\), it shows that the degree of the truth-membership of \(x\) with respect to the \(u\) is not less than \(s\), and the degree of the indeterminacy-membership of \(u\) with respect to the parameter \(x\) is not more than \(t\) and the degree of the falsity-membership of \(u\) with respect to the parameter \(x\) is not more than \(q\). In practical applications of IVNP-soft sets, the thresholds \(s, t, q \subseteq [0, 1]\) is pre-established by decision makers and reflect decision makers requirements on “truth-membership levels”, “indeterminacy-membership levels” and “falsity-membership levels”. 

\textbf{Definition 4.2} Let \(\Psi \in \text{IVNPS}\) and \(a = [s, s], = [t, t], = [q_{min}, q] \subseteq [0, 1]\) which is called a threshold of IVNSP-soft set. The level soft set of \(\Psi_K\) with respect to \((s, t, q_{min})\) is a crisp soft set, denoted by \((\Psi_K; (s, t, q_{min}))\), defined by:
\begin{align*}
(\Psi_K; (s, t, q_{min})) &= \{((x_i, (x_i)) : x_i \in E) \\
) &\text{where} \\
) &s, t, t, \text{and } t, q
\end{align*}

\begin{align*}
\inf \{\mu: x_i \in E\}, & \text{ and } \inf \{\mu: x_i \in E\} \\
\inf \{\nu: x_i \in E\}, & \text{ and } \inf \{\omega: x_i \in E\}
\end{align*}

The \((s_{min}, t_{min}, q_{min})\) is called the mmm-threshold of the IVNP-soft set \(\Psi_K\). In the following discussions, the mmm-level decision rule will mean using the mmm-threshold and considering the mmm-level soft set in IVNP-soft sets based decision making.

\textbf{Definition 4.3} Let \(\Psi \in \text{IVNPS}\) and \(a = [s, s], = [t, t], = [q_{mid}, q_{mid}] \subseteq [0, 1]\) which is called a threshold of IVNSP-soft set. The level soft set of \(\Psi_K\) with respect to \((s, t_{mid}, q_{mid})\) is a crisp soft set, denoted by \((\Psi_K; (s, t_{mid}, q_{mid}))\), defined by:
\begin{align*}
(\Psi_K; (s, t_{mid}, q_{mid})) &= \{((x_i, (x_i)) : x_i \in E) \\
) &\text{where} \\
) &s, t, t, \text{and } t, q
\end{align*}

\begin{align*}
\Sigma_{x \in E} \mu, & \text{ and } \Sigma_{x \in E} \mu \\
\Sigma_{x \in E} \nu, & \text{ and } \Sigma_{x \in E} \omega
\end{align*}
\[ q_{\text{mid}} = \sum_{x \in E^*} \omega_K^U(x_i)/|E^*|, \quad q_{\text{mid}} = \sum_{x \in E^*} \omega_K^U(x_i)/|E^*| \]

For all \( x_i \in E^* \), where if \( x_i \in E/E^* \) then \( \Psi_K(x_i) = \emptyset \).

The \((s_{\text{mid}}, t_{\text{mid}}, q_{\text{mid}})\) is called the mmm-threshold of the IVNP-soft set \( \Psi_K \). In the following discussions, the mid-level decision rule will mean using the mid-threshold and considering the mid-level soft set in IVNP-soft sets based decision making.

**Definition 4.4** Let \( \Psi_K \in \text{IVNPS} \) and an \( s_{\text{max}} = [s_{\text{max}}, s_{\text{max}}^+]\), \( t_{\text{min}} = [t_{\text{min}}, t_{\text{min}}^+]\), \( q_{\text{min}} = [q_{\text{min}}, q_{\text{min}}^+] \subseteq [0, 1] \) which is called a threshold of IVNSP-soft set. The level soft set of \( \Psi_K \) with respect to \((s_{\text{max}}, t_{\text{min}}, q_{\text{min}})\) is a crisp soft set, denoted by \((\Psi_K; (s_{\text{max}}, t_{\text{min}}, q_{\text{min}}))\), defined by:

\[
(\Psi_K; (s_{\text{max}}, t_{\text{min}}, q_{\text{min}})) = \{(x_i, \Psi_K(x_i)) : x_i \in E\}
\]

where,

\[
s_{\text{max}}^+ \leq \mu^L_K(x_i), s_{\text{max}} \leq \mu^U_K(x_i), t_{\text{min}}^+ \geq v^L_K(x_i), t_{\text{min}} \geq v^U_K(x_i) \quad \text{and} \quad q_{\text{min}}^+ \geq \omega^L_K(x_i), q_{\text{min}} \leq \omega^U_K(x_i)
\]

The \((s_{\text{max}}, t_{\text{min}}, q_{\text{min}})\) is called the Mmm-threshold of the IVNP-soft set \( \Psi_K \). In the following discussions, the Mmm-level decision rule will mean using the Mmm-threshold and considering the Mmm-level soft set in IVNP-soft sets based decision making.

**Definition 4.5** Let \( \Psi_K \in \text{IVNPS} \). The threshold based on median could be expressed as a function \( \text{med}_\theta : A \rightarrow [0, 1]^3 \), i.e. \( s_{\text{med}} = [s_{\text{med}}, s_{\text{med}}^+]\), \( t_{\text{med}} = [t_{\text{med}}, t_{\text{med}}^+]\), \( q_{\text{med}} = [q_{\text{med}}, q_{\text{med}}^+] \subseteq [0, 1] \) for all \( \epsilon \in A \), where for \( \forall \epsilon \in A, s_{\text{med}} \), \( s_{\text{med}}^+ \) is the median by ranking the degree of interval truth membership of all alternatives according to order from large to small (or from small to large), namely

\[
\begin{align*}
s_{\text{med}}^- &= \begin{cases} 
    \mu^L_K\left(x_{\left(\frac{|E|+1}{2}\right)}\right) & \text{if } |E| \text{ is odd} \\
    \left(\mu^L_K\left(x_{\left(\frac{|E|}{2}\right)}\right) + \mu^L_K\left(x_{\left(\frac{|E|+1}{2}\right)}\right)\right)/2 & \text{if } |E| \text{ is even}
\end{cases} \\
s_{\text{med}}^+ &= \begin{cases} 
    \mu^U_K\left(x_{\left(\frac{|E|+1}{2}\right)}\right) & \text{if } |E| \text{ is odd} \\
    \left(\mu^U_K\left(x_{\left(\frac{|E|}{2}\right)}\right) + \mu^U_K\left(x_{\left(\frac{|E|+1}{2}\right)}\right)\right)/2 & \text{if } |E| \text{ is even}
\end{cases}
\end{align*}
\]

\( t_{\text{med}}, t_{\text{med}}^+ \) is the median by ranking the degree of interval indeterminacy membership of all alternatives according to order from large to small (or from small to large), namely
And \( q_{med} . q \) is the median by ranking the interval degree of falsity membership of all alternatives according to order from large to small (or from small to large), namely

\[
\text{Example 4.6} \quad \Psi_K = \{(\langle x_1 , [0.1,0.5], [0.4, 0.5] , [0.2, 0.3]\rangle,\{u_1 , u_2 \}), (\langle x_2 , [0.2,0.3], [0.5, 0.7], [0.1, 0.3]\rangle,\{u_2 , u_3 \}), (\langle x_3 , [0.1,0.3], [0.1, 0.7] , [0.3, 0.4]\rangle,\{u_1 , u , u_3 \})\}
\]

Then

\[
\text{Theorem 4.7.} \quad \text{Let } \Psi_K \in \text{IVNP-soft set } (\Psi_K ; (s_{mid}, t_{mid}, q_{mid})), (\Psi_K ; (s_{min}, t_{min}, q_{min}))-\text{level soft set of } \Psi_K , \text{respectively. Then,}
\]

<table>
<thead>
<tr>
<th>1. ( (s ; t , q) )</th>
<th>( (s , t , q) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( (s ; t , q) )</td>
<td>( (s , t , q) )</td>
</tr>
<tr>
<td>( (s ; t , q) )</td>
<td>( (s , t , q) )</td>
</tr>
<tr>
<td>( (s ; t , q) )</td>
<td>( (s , t , q) )</td>
</tr>
</tbody>
</table>

\[
\text{Proof.} \quad \text{Let } \Psi_K \in \text{IVNPSS. From definition, definition and definition, it can be seen that}
\]

\[
\text{...}
\]
Thus

i. for all $x_i \in E$ which providing the inequalities $(x_i, \Psi_K(x_i) \notin (\Psi_K; (s_{\text{max}} , t , q ))$.

So, $(\Psi_K; (s , t , q )) \subseteq ( \Psi_K; (s , t , q ))$

ii. it can be proved similar way

Now, we construct an IVNP –soft sets decision making method by the following algorithm:

Algorithm:

Step 1. Input the IVNP –soft sets -soft set $\Psi$

Step 2. Input a threshold $(s_{\text{mid}}, t_{\text{mid}}, q_{\text{mid}})$ ( or $(s_{\text{max}}, t_{\text{min}}, q_{\text{min}})$ ) by using mid –level decision rule ( or Mmm-level decision rule, mmm-level decision rule) for decision making.

Step 3. Compute mid-level soft set $(s , t , q )$ ( or Mmm-level soft set $(s , t , q )$), mid –level soft set $(s , t , q )$, Med –level soft set $(s , t , q )$.

Step 4. Present the level soft set $(\Psi_K; (s , t , q ))$ (or the level soft set $(\Psi_K; (s , t , q ))$, the level soft set $(\Psi_K; (s , t , q ))$, Med–level soft set $(\Psi_K; (s , t , q ))$ in tabular form.

Step 5. Compute the choice value $c_i$ of for any $x_i \in U$.

Step 6. The optimal decision is to select $c_i = \max_{x_i \in U}$ 

Remark If $k$ has more than one value then any one of $x_k$ may be chosen. If there are too many optimal choices in Step 6, we may go back to the second step and change the threshold (or decision rule) such that only one optimal choice remains in the end.

Example 4.8. Assume that a company wants to fill a position. There are 4 candidates who fill in a form in order to apply formally for the position. There is a decision maker (DM) that is from the department of human resources. He wants to interview the candidates, but it is very difficult to make it all of them. Therefore, by using the parameter reduction method, the numbers of candidates are reduced to a suitable one. Assume that the set of candidates $U=\{u_1, u_2, u_3, u_4, u_5, u_6, u_7\}$ which may be characterized by a set of parameters $E=\{x_1, x_2, x_3, x_4, x_5, x_6\}$ For $i=1,2,3,4,5,6$ the parameters $i$ stand for experience, computer knowledge, training, young age, diction and flexible working hours compatible, respectively. Now, we can apply the method as follows:

Step 1. After thinking thoroughly, he/she evaluates the alternative according to choosing parameters and constructs an IVNP-soft set $\Psi_K$ as follows

\[ = \{(x_1, ([0.6, 0.8], [0.1, 0.2], [0.3, 0.5])), (x_2, ([0.5, 0.6], [0.3, 0.4], [0.2, 0.3])), (x_3, ([0.4, 0.5], [0.3, 0.4], [0.1, 0.4])), (x_4, ([0.1, 0.2], [0.4, 0.8], [0.4, 0.5])), (x_5, ([0.4, 0.5], [0.2, 0.4], [0.3, 0.6])), (x_6, ([0.7, 0.7], [0.1, 0.3], [0.1, 0.5])), (x_7, ([0.45, 0.655], [0.23, 0.41], [0.23, 0.46]))\}\]

Step 2. Then, we have

\[ t = [0.45, 0.655], \quad q = [0.23, 0.41] \]
\[ t = [0.23, 0.46], \quad q = [0.7, 0.8] \]
\[ t = [0.1, 0.2], \quad q = [0.1, 0.3] \]
Step 3. Thus, the \((s_{med}, t_{med}, q_{med})\)-level soft set of is (after the necessary calculations, they can be seen that \((s_{med}, t_{med}, q_{med})\)-level soft set, \((s_{mid}, t_{med}, q_{min})\)-level soft set, and \((s_{mid}, t_{med}, q_{min})\)-level soft set of are not suitable for decision making in this problem.)

\[
\Psi_K; (s \cdot t \cdot q) = \{(<x_2, ([0.5, 0.6], [0.3, 0.4], [0.2, 0.3])>, \{u_2, u_5, u_6, u_8\}) ,
\langle x_3, ([0.4, 0.5], [0.3, 0.4], [0.1, 0.4])\rangle, \{u_2, u_3, u_6, u_7\})\}
\]

Step 4. Tabular form of \((\Psi_K; (s \cdot t \cdot q)\) is

<p>| | | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Step 5. Then, we have the choice value \(c_i\) for \(i = 1, 2, 3, \ldots, 8\)

\[c_1 = 0, c_2 = 2, c_3 = 1, c_4 = 0, c_5 = 1, c_6 = 2, c_7 = 1\) and \(c_8 = 1\)

Step 6. So, the optimal decision is \(u_2\) or \(u\)

Note that this decision making method can be applied for group decision making easily with help of the definition 3.19.

5. Conclusions

In this work, we have introduced the concept of interval valued neutrosophic parameterized soft set and studied some of its properties. The complement, union and intersection operations have been defined on the interval valued neutrosophic parameterized soft set. The definition of parameter reduction method is introduced with application of this operation in decision making problems.
