Outline

Background

Bayesian Network Algebraic Decision Diagram Sum-Product Network

Main Result

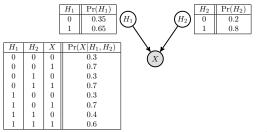

Main Theorems Sum-Product Network to Bayesian Network Bayesian Network to Sum-Product Network

Discussion

Definition

A graphical representation of a set of random variables $X_{1:N}$ and their conditional dependencies.

 Node corresponds to random variables (observable or latent) and edges represent conditional dependency between pairs of variables.

Definition

A graphical representation of a set of random variables $X_{1:N}$ and their conditional dependencies.

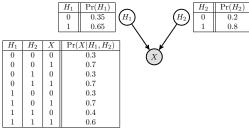

- Node corresponds to random variables (observable or latent) and edges represent conditional dependency between pairs of variables.
- Each node is associated with a local conditional probability distribution (CPD).

Definition

A graphical representation of a set of random variables $X_{1:N}$ and their conditional dependencies.

- Node corresponds to random variables (observable or latent) and edges represent conditional dependency between pairs of variables.
- Each node is associated with a local conditional probability distribution (CPD).
- A directed acyclic graph (DAG).

Bayesian Network Definition

Local Markov property: each variable is conditionally independent of its non-descendants given its parents.

$$\mathsf{Pr}(\mathbf{X}_{1:N}) = \prod_{i=1}^{N} \mathsf{Pr}(X_i \mid \mathbf{X}_{1:i-1}) = \prod_{i=1}^{N} \mathsf{Pr}(X_i \mid \mathsf{Pa}(X_i))$$

Bayesian Network Definition

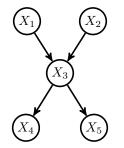

Local Markov property: each variable is conditionally independent of its non-descendants given its parents.

$$\mathsf{Pr}(\mathbf{X}_{1:N}) = \prod_{i=1}^{N} \mathsf{Pr}(X_i \mid \mathbf{X}_{1:i-1}) = \prod_{i=1}^{N} \mathsf{Pr}(X_i \mid \mathsf{Pa}(X_i))$$

Independence induced by the structure of BN

Example

A Bayesian Network over 5 random variables:

 $\Pr(\mathbf{X}_{1:5}) = \Pr(X_5 | \mathbf{X}_{1:4}) \Pr(X_4 | \mathbf{X}_{1:3}) \Pr(X_3 | \mathbf{X}_{1:2}) \Pr(X_2 | X_1) \Pr(X_1)$

WATERLOO | CHERITON SCHOOL OF COMPUTER SCIENCE

Example

A Bayesian Network over 5 random variables:

 $\begin{aligned} \mathsf{Pr}(\mathbf{X}_{1:5}) &= \; \mathsf{Pr}(X_5 | \mathbf{X}_{1:4}) \, \mathsf{Pr}(X_4 | \mathbf{X}_{1:3}) \, \mathsf{Pr}(X_3 | \mathbf{X}_{1:2}) \, \mathsf{Pr}(X_2 | X_1) \, \mathsf{Pr}(X_1) \\ &= \; \mathsf{Pr}(X_5 | X_3) \, \mathsf{Pr}(X_4 | X_3) \, \mathsf{Pr}(X_3 | X_1, X_2) \, \mathsf{Pr}(X_2) \, \mathsf{Pr}(X_1) \end{aligned}$

Inference

Joint, marginal and conditional probabilistic query in Bayesian Network. Consider the marginal query $Pr(X_N = True)$

$$\Pr(X_N = \texttt{True}) = \sum_{X_1} \cdots \sum_{X_{N-1}} \Pr(\mathbf{X}_{1:N-1}, X_N = \texttt{True})$$

Inference

Joint, marginal and conditional probabilistic query in Bayesian Network. Consider the marginal query $Pr(X_N = True)$

$$\Pr(X_N = \operatorname{True}) = \sum_{X_1} \cdots \sum_{X_{N-1}} \Pr(\mathbf{X}_{1:N-1}, X_N = \operatorname{True})$$

Naive enumeration is exponential in the number of variables

Inference

0	1	1	1	0.3	1	1	1	1	0.1

Observation: Once $X_1 = 0$, the value of the function is independent of the value taken by X_2 .

Motivation

Let X, Y and Z be three random variables.

WATERLOO | CHERITON SCHOOL OF COMPUTER SCIENCE

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・ つへぐ

Motivation

Let X, Y and Z be three random variables.

Independence

 $X \perp Y \Rightarrow \forall x, y \quad \Pr(x, y) = \Pr(x) \Pr(y)$

Motivation

Let X, Y and Z be three random variables.

Independence

$$X \perp Y \Rightarrow \forall x, y \quad \Pr(x, y) = \Pr(x) \Pr(y)$$

Conditional Independence

 $X \perp\!\!\!\perp Y \mid Z \Rightarrow \forall x, y, z \quad \Pr(x, y|z) = \Pr(x|z) \Pr(y|z)$

Motivation

Let X, Y and Z be three random variables.

Independence

$$X \perp Y \Rightarrow \forall x, y \quad \Pr(x, y) = \Pr(x) \Pr(y)$$

Conditional Independence

$$X \perp Y \mid Z \Rightarrow \forall x, y, z \quad \Pr(x, y \mid z) = \Pr(x \mid z) \Pr(y \mid z)$$

Context Specific conditional Independence (CSI)

$$X \perp\!\!\!\perp Y \mid Z = z \Rightarrow \exists z \forall x, y \quad \mathsf{Pr}(x, y | z) = \mathsf{Pr}(x | z) \mathsf{Pr}(y | z)$$

Motivation

Let X, Y and Z be three random variables.

Independence

$$X \perp Y \Rightarrow \forall x, y \quad \Pr(x, y) = \Pr(x) \Pr(y)$$

Conditional Independence

$$X \perp \!\!\!\!\perp Y \mid Z \Rightarrow \forall x, y, z \quad \Pr(x, y \mid z) = \Pr(x \mid z) \Pr(y \mid z)$$

Context Specific conditional Independence (CSI)

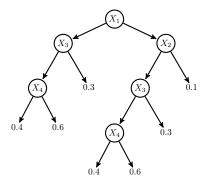

$$X \perp Y \mid Z = z \Rightarrow \exists z \forall x, y \quad \Pr(x, y \mid z) = \Pr(x \mid z) \Pr(y \mid z)$$

Both independence and conditional independence can be encoded in the structure of Bayesian Network, but CSI cannot.

Motivation

Decision Tree representation

Use decision tree to capture the context specific dependencies

X_1	X_2	X_3	X_4	$f(\cdot)$	X_1	X_2	X_3	X_4	$f(\cdot)$
0	0	0	0	0.4	1	0	0	0	0.4
0	0	0	1	0.6	1	0	0	1	0.6
0	0	1	0	0.3	1	0	1	0	0.3
0	0	1	1	0.3	1	0	1	1	0.3
0	1	0	0	0.4	1	1	0	0	0.1
0	1	0	1	0.6	1	1	0	1	0.1
0	1	1	0	0.3	1	1	1	0	0.1
0	1	1	1	0.3	1	1	1	1	0.1

 X_2 does not appear in the left branch of X_1 and X_4 does not appear in the branch when X_3 takes value 1.

- - 30 / 90

Motivation

Algebraic Decision Diagram

Decision Tree cannot reuse isomorphic sub-graphs

Using directed acyclic graphs instead of trees!

WATERLOO | CHERITON SCHOOL OF COMPUTER イロト イポト イヨト イヨト

3

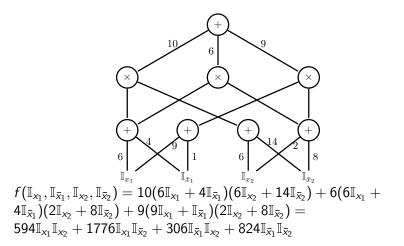

Discussion

- Algebraic Decision Diagram is a data structure to compactly encode any discrete function with finite support.
- Context Specific Independence (CSI) can be encoded using Algebraic Decision Diagram (better than tabular representation).
- Efficiently avoid the replication problem by reusing isomorphic subgraph (better than decision tree representation).
- We use Algebraic Decision Diagram to encode local CPDs in Bayesian Network.

Definition

- A Sum-Product Network is a
 - Directed acyclic graph of indicator variables, sum nodes and product nodes.
 - Each edge emanated from a sum node is associated with a non-negative weight.
 - ► Value of a product node is the product of its children.
 - ► Value of a sum node is the weighted sum of its children.

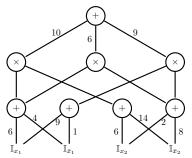

Example

Inference

Joint/Marginal/Conditional queries can be answered in linear time in Sum-Product Network.

Joint Inference $Pr(X_1 = 1, X_2 = 0)$?

Conditional Inference $Pr(X_2 = 0|X_1 = 1)$? $Pr(X_2 = 0|X_1 = 1) = \frac{Pr(X_1=1,X_2=0)}{Pr(X_1=1)}$

Inference

Joint/Marginal/Conditional queries can be answered in linear time in Sum-Product Network.

Conditional Inference $Pr(X_2 = 0 | X_1 = 1)$? $Pr(X_2 = 0 | X_1 = 1) = \frac{Pr(X_1=1, X_2=0)}{Pr(X_1=1)}$ Two passes through the Sum-Product Network, one to compute $Pr(X_1 = 1, X_2 = 0)$, the other to compute $Pr(X_1 = 1)$.

Deep Learning Perspective

Deep structure

- ► Sum node ⇔ Weighted linear activation function
- Product node ⇔ Component-wise nonlinear activation function

◆□▶ ◆□▶ ◆三▶ ◆三▶ - 三 - つくで

Definition

Definition (scope)

The *scope* of a node in an SPN is defined as the set of variables that have indicators among the node's descendants: For any node v in an SPN, if v is a terminal node, say, an indicator variable over X, then scope(v) = {X}, else scope(v) = $\bigcup_{\tilde{v} \in Ch(v)} \text{scope}(\tilde{v})$.

Definition (Complete)

An SPN is complete iff each sum node has children with the same scope.

Definition (Consistent)

An SPN is consistent iff no variable appears negated in one child of a product node and non-negated in another.

1

Definition

Definition (Decomposable)

An SPN is decomposable iff for every product node v, scope $(v_i) \cap$ scope $(v_j) = \emptyset$ where $v_i, v_j \in Ch(v), i \neq j$.

Definition (Valid)

An SPN is said to be *valid* iff it defines a (unnormalized) probability distribution.

Theorem (Poon and Domingos)

If an SPN S is complete and consistent, then it is valid.

Definition

Definition (Decomposable)

An SPN is decomposable iff for every product node v, scope $(v_i) \cap$ scope $(v_j) = \emptyset$ where $v_i, v_j \in Ch(v), i \neq j$.

Definition (Valid)

An SPN is said to be *valid* iff it defines a (unnormalized) probability distribution.

Theorem (Poon and Domingos)

If an SPN S is complete and consistent, then it is valid.

Valid SPN induces a (unnormalized) probability distribution by the network polynomial defined by the root of the SPN.

Main Theorems SPN-BN

Let |S| be the size of the SPN, i.e., the number of nodes plus the number of edges in the graph. For a BN B, the size of B, |B|, is defined by the size of the graph *plus* the size of all the CPDs in B.

Main Theorems SPN-BN

Let |S| be the size of the SPN, i.e., the number of nodes plus the number of edges in the graph. For a BN \mathcal{B} , the size of \mathcal{B} , $|\mathcal{B}|$, is defined by the size of the graph *plus* the size of all the CPDs in \mathcal{B} .

Theorem (SPN-BN)

There exists an algorithm that converts any complete and decomposable SPN S over Boolean variables $X_{1:N}$ into a BN B with CPDs represented by ADDs in time O(N|S|). Furthermore, S and B represent the same distribution and |B| = O(N|S|).

Main Theorems SPN-BN

Let |S| be the size of the SPN, i.e., the number of nodes plus the number of edges in the graph. For a BN \mathcal{B} , the size of \mathcal{B} , $|\mathcal{B}|$, is defined by the size of the graph *plus* the size of all the CPDs in \mathcal{B} .

Theorem (SPN-BN)

There exists an algorithm that converts any complete and decomposable SPN S over Boolean variables $X_{1:N}$ into a BN B with CPDs represented by ADDs in time O(N|S|). Furthermore, S and B represent the same distribution and |B| = O(N|S|).

Corollary (SPN-BN)

There exists an algorithm that converts any complete and consistent SPN S over Boolean variables $X_{1:N}$ into a BN B with CPDs represented by ADDs in time $O(N|S|^2)$. Furthermore, S and B represent the same distribution and $|B| = O(N|S|^2)$.

Main Theorems

WATERLOO | CHERITON SCHOOL OF COMPUTER SCIENCE

・ロト・西ト・ヨト・ヨー うへぐ

57 / 90

Main Theorems

Remark

The BN \mathcal{B} generated from \mathcal{S} has a simple bipartite DAG structure, where all the source nodes are hidden variables and the terminal nodes are the Boolean variables $X_{1:N}$.

Main Theorems

Remark

The BN \mathcal{B} generated from \mathcal{S} has a simple bipartite DAG structure, where all the source nodes are hidden variables and the terminal nodes are the Boolean variables $X_{1:N}$.

Remark

Assuming sum nodes alternate with product nodes in SPN S, the depth of S is proportional to the maximum in-degree of the nodes in B, which, as a result, is proportional to a lower bound of the tree-width of B.

59/90

Main Theorems **BN-SPN**

Theorem (BN-SPN)

Given the BN \mathcal{B} with ADD representation of CPDs generated from a complete and decomposable SPN S over Boolean variables $X_{1:N}$, the original SPN S can be recovered by applying the Variable Elimination algorithm to \mathcal{B} in $O(N|\mathcal{S}|)$.

3

Main Theorems BN-SPN

Theorem (BN-SPN)

Given the BN \mathcal{B} with ADD representation of CPDs generated from a complete and decomposable SPN \mathcal{S} over Boolean variables $X_{1:N}$, the original SPN \mathcal{S} can be recovered by applying the Variable Elimination algorithm to \mathcal{B} in $O(N|\mathcal{S}|)$.

Remark

The combination of the above two theorems shows that distributions for which SPNs allow a compact representation and efficient inference, BNs with ADDs also allow a compact representation and efficient inference (i.e., no exponential blow up).

Normal Sum-Product Network

Definition

Definition (Normal Sum-Product Network)

An SPN is said to be normal if

- 1. It is complete and decomposable.
- 2. For each sum node in the SPN, the weights of the edges emanating from the sum node are nonnegative and sum to 1.
- 3. Every terminal node in an SPN is a univariate distribution over a Boolean variable and the size of the scope of a sum node is at least 2 (sum nodes whose scope is of size 1 are reduced into terminal nodes).

65 / 90

Normal Sum-Product Network

Definition

Definition (Normal Sum-Product Network)

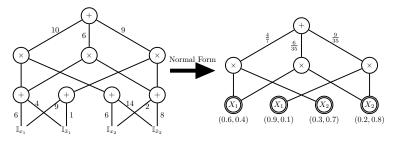

An SPN is said to be normal if

- 1. It is complete and decomposable.
- 2. For each sum node in the SPN, the weights of the edges emanating from the sum node are nonnegative and sum to 1.
- 3. Every terminal node in an SPN is a univariate distribution over a Boolean variable and the size of the scope of a sum node is at least 2 (sum nodes whose scope is of size 1 are reduced into terminal nodes).

Theorem (Normal Transformation)

For any complete and consistent SPN S, there exists a normal SPN S' such that $\Pr_{S}(\cdot) = \Pr_{S'}(\cdot)$ and $|S'| = O(|S|^2)$.

Normal Sum-Product Network Example

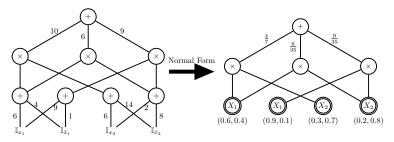

Each terminal node is a univariate distribution.

WATERLOO CHERITON SCHOOL OF COMPUTER SCIENCE

<ロト < 団ト < 巨ト < 巨ト < 巨ト 三 の Q (C 67 / 90

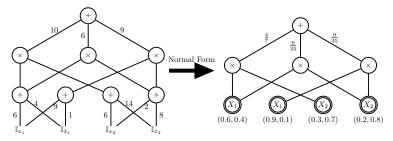

Normal Sum-Product Network Example

- Each terminal node is a univariate distribution.
- Each internal sum node corresponds to a hidden variable with multinomial distribution which defines a mixture model.

3

Normal Sum-Product Network Example

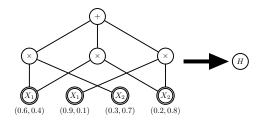

- Each terminal node is a univariate distribution.
- Each internal sum node corresponds to a hidden variable with multinomial distribution which defines a mixture model.
- Each internal product node encodes a rule of context specific independence over its children.

SPN-BN

Structure Construction

Given a normal SPN S over $\mathbf{X}_{1:N}$, construct:

• A hidden node H_v for each sum node v in S.

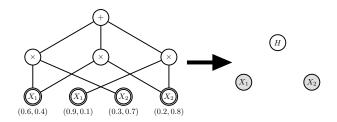

SPN-BN

Structure Construction

Given a normal SPN S over $\mathbf{X}_{1:N}$, construct:

- A hidden node H_v for each sum node v in S.
- An observable node X_n for each variable X_n in S.

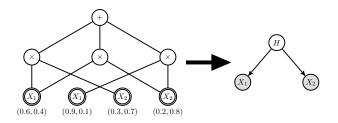

SPN-BN

Structure Construction

Given a normal SPN S over $\mathbf{X}_{1:N}$, construct:

- A hidden node H_v for each sum node v in S.
- An observable node X_n for each variable X_n in S.
- ► A directed from H_v to X_n iff X_n appears in the sub-SPN rooted at v in S.

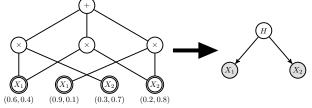

SPN-BN

Structure Construction

Given a normal SPN S over $\mathbf{X}_{1:N}$, construct:

- A hidden node H_v for each sum node v in S.
- An observable node X_n for each variable X_n in S.
- ► A directed from H_v to X_n iff X_n appears in the sub-SPN rooted at v in S.

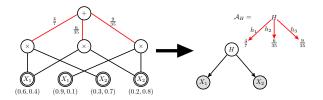

The structure of \mathcal{B} is a directed bipartite graph, with a layer of hidden nodes pointing to a layer of observable nodes.

Given a normal SPN S over $\mathbf{X}_{1:N}$, construct:

► A decision stump from the sum node v for each hidden node H_v.

SPN-BN

CPD Construction

Given a normal SPN $\mathcal S$ over $\boldsymbol X_{1:\textit{N}},$ construct:

- ► A decision stump from the sum node v for each hidden node H_v.
- ► An induced sub-SPN S_{X_n} by node set {X_n} from S and then contract all the product nodes in S_{X_n}.

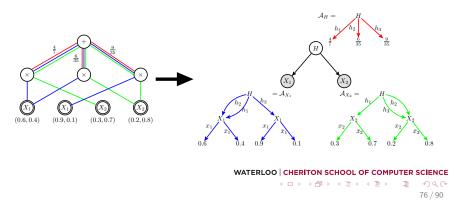

SPN-BN

CPD Construction

Given a normal SPN S over $X_{1:N}$, construct:

- ► A decision stump from the sum node v for each hidden node H_v.
- ► An induced sub-SPN S_{X_n} by node set {X_n} from S and then contract all the product nodes in S_{X_n}.

Theorems

Theorem

For any normal SPN S over $\mathbf{X}_{1:N}$, the constructed BN B encodes the same probability distribution, i.e., $\Pr_{\mathcal{S}}(\mathbf{x}) = \Pr_{\mathcal{B}}(\mathbf{x}), \forall \mathbf{x}$.

Theorems

Theorem

For any normal SPN S over $X_{1:N}$, the constructed BN B encodes the same probability distribution, i.e., $\Pr_{\mathcal{S}}(\mathbf{x}) = \Pr_{\mathcal{B}}(\mathbf{x}), \forall \mathbf{x}$.

Theorem

There exists an algorithm, for any normal SPN S over $X_{1:N}$, constructs an equivalent BN in time O(N|S|).

Theorems

Theorem

For any normal SPN S over $X_{1:N}$, the constructed BN B encodes the same probability distribution, i.e., $\Pr_{\mathcal{S}}(\mathbf{x}) = \Pr_{\mathcal{B}}(\mathbf{x}), \forall \mathbf{x}$.

Theorem

There exists an algorithm, for any normal SPN S over $X_{1:N}$, constructs an equivalent BN in time O(N|S|).

Theorem

 $|\mathcal{B}| = O(N|\mathcal{S}|)$, where BN \mathcal{B} is constructed from the normal SPN S over $X_{1 \cdot N}$.

Extend Algebraic Decision Diagram to *Symbolic* Algebraic Decision Diagram where $+, -, \times, /$ are allowed to be internal nodes.

Extend Algebraic Decision Diagram to *Symbolic* Algebraic Decision Diagram where $+, -, \times, /$ are allowed to be internal nodes.

Example

Given symbolic ADDs \mathcal{A}_{X_1} over X_1 and \mathcal{A}_{X_2} over X_2 . A symbolic ADD \mathcal{A}_{X_1,X_2} over X_1, X_2 encodes a function over X_1 and X_2 such that $\mathcal{A}_{X_1,X_2}(x_1, x_2) \triangleq (\mathcal{A}_{X_1} \otimes \mathcal{A}_{X_2})(x_1, x_2) = \mathcal{A}_{X_1}(x_1) \times \mathcal{A}_{X_2}(x_2)$.

Extend Algebraic Decision Diagram to *Symbolic* Algebraic Decision Diagram where $+, -, \times, /$ are allowed to be internal nodes.

Example

Given symbolic ADDs \mathcal{A}_{X_1} over X_1 and \mathcal{A}_{X_2} over X_2 . A symbolic ADD \mathcal{A}_{X_1,X_2} over X_1, X_2 encodes a function over X_1 and X_2 such that $\mathcal{A}_{X_1,X_2}(x_1,x_2) \triangleq (\mathcal{A}_{X_1} \otimes \mathcal{A}_{X_2})(x_1,x_2) = \mathcal{A}_{X_1}(x_1) \times \mathcal{A}_{X_2}(x_2)$. Define two operations in symbolic ADD:

- Multiplication between pairs of symbolic ADDs
- Summing Out one internal variable in symbolic ADD

Theorem (SPN-BN)

There exists a variable ordering such that applying Variable Elimination with the ordering to BN with ADDs builds the original SPN S in O(N|S|).
