**Objectives:** To investigate the effects of scapular muscle training with proprioceptive neuromuscular facilitation techniques (PNF) on shoulder muscle strength, endurance and function in subjects with winging scapula.

**Methods:** Forty subjects with bilateral winging scapula were randomly allocated into PNF Group (n=20, age:20.85±1.34 years), and Controls (n=20, age:20.77±1.77 years). PNF techniques in scapular diagonals were applied for scapular positioning and toning of the surrounding muscles for 3 days/week, 5 weeks. Shoulder muscle strength was evaluated diagonally with BiodeX System 3 Pro isokinetic dynamometer (BiodeX Medical Systems, Shirley, USA) at 60 and 180°/s. The scapular muscle endurance with Scapular Isometric Pinch Test, functional ability with Disability of the Arm, Shoulder and Hand Questionnaire (DASH) was assessed. Paired and independent t tests were used for analysis.

**Results:** For pre (1) and post (2) applications, significant improvement on 60°/s flexion peak torque/bodyweight (1:36.78±13.05; 2:61.22±29.75), 60°/s extension peak torque/bodyweight (1:65.35±23.27; 2:80.18±38.66), 180°/s flexion peak torque/bodyweight (1:40.69±15.32; 2:50.84±23.90) on dominant sides; scapular endurance (1:31.95±23.06; 2:51.15±31.08 sn) and DASH score (1:7.86±12.00; 2:5.25±9.28) were found in PNF group ( $p<0.05$ ). However, no significant difference was observed for Controls ( $p>0.05$ ). Scapular endurance, flexion and extension peak torque/bodyweight at 60°/s were different in favor of PNF group in intergroup comparisons ( $p<0.05$ ).

**Conclusion:** Scapular muscle training with PNF may be effective in improving scapular and shoulder muscle strength, endurance and function in subjects with winging scapula.
