# Problem Statement

The heterogeneity of in-car networking

Tomorrow's In-Car  
Interconnect?

T. Steinbach

- The in-car network grew over the past decades
- Increasing demand continuously required introduction of new technologies
- Today, extremely heterogeneous network formed of domain specific systems
  - CAN, FlexRay, MOST ...
- Abstraction layers (e.g. AUTOSAR) introduced interface to applications
- On the transport layer still very high complexity

Problem Statement &  
Motivation

Background &  
Related Work

Evaluation &  
Comparison

Conclusion &  
Outlook

- Ethernet offers:
  - Mature technology
  - High transmission bandwidth
  - Low prices for components
  - Many development/diagnostic tools and expert developers
- Ethernet considered for (or already used):
  - On-Board Diagnosis (OBD)
  - Multimedia
  - Image transmission (Camera)
- But: Ethernet as additional transport technology cannot reduce complexity

Tomorrow's In-Car  
Interconnect?

T. Steinbach

Problem Statement &  
Motivation

Background &  
Related Work

Evaluation &  
Comparison

Conclusion &  
Outlook

- What if Ethernet could be used as the medium for a uniform homogeneous in-car backbone?

## IEEE 802.1 Audio Video Bridging Protocol suite

- Stream Reservation Protocol
  - Online signaling protocol for traffic flows
  - reserves required bandwidth for a specific stream
- Queuing and Forwarding Rules
  - Based on IEEE 802.1Q, Mapping of priority values to AVB classes
  - Strict Priority Algorithm for Legacy Ethernet
  - Credit Based Shaper Algorithm for AVB
  - Maximum latency of 2ms over 7 Hops (Class A) or 50ms (Class B)

Time-triggered Ethernet

Evaluation &  
Comparison

Conclusion &  
Outlook

# Time-triggered Ethernet (AS6802)

Mixed critical applications through IEEE 802 networks

Tomorrow's In-Car  
Interconnect?

T. Steinbach

- Extension to standard switched Ethernet
- SAE standardized in 2011 (AS6802)
- 3 traffic classes:
  - 1** Time-triggered (TT)  
highest priority, time-triggered, cyclic, offline  
planned, requires synchronised time
  - 2** Rate-constrained (RC)  
event-triggered, bandwidth-based (AFDX)
  - 3** Best-effort (BE)  
lowest priority, standard Ethernet

Problem Statement &

Evaluation & Toolchain  
Scenario  
**Results**

Conclusion &  
Outlook

Type of Stream	IEEE 802.1 AVB		TTEthernet	
	Latency [ $\mu$ s]	Jitter [ $\mu$ s]	Latency [ $\mu$ s]	Jitter [ $\mu$ s]
Camera	115.40	6.69	209.77	90.98
TV	674.32	135.80	485.18	117.27
Media Audio	497.67	6.11	610.49	117.28
Media Video	503.68	130.70	725.37	232.15

# Control Traffic

## Cumulative Distribution

Tomorrow's In-Car Interconnect?

T. Steinbach

Problem Statement & Motivation

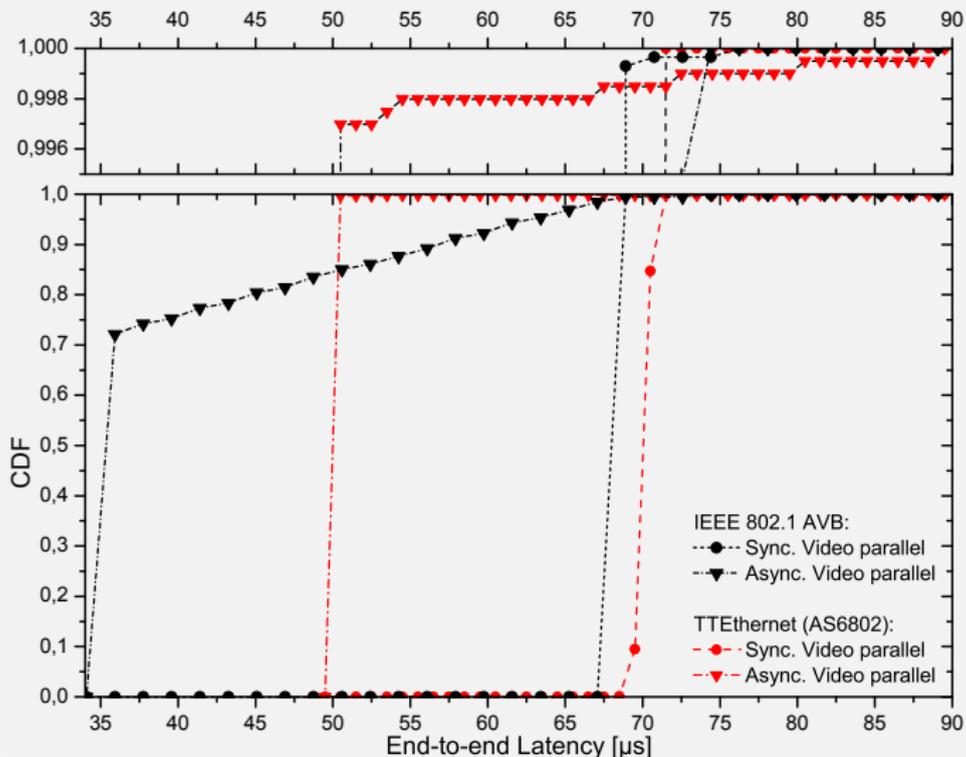

Background & Related Work

Evaluation & Comparison

Evaluation & Toolchain Scenario

**Results**

Conclusion & Outlook

Hops	Type	IEEE 802.1 AVB		TTEthernet	
		Latency [ $\mu$ s]	Jitter [ $\mu$ s]	Latency [ $\mu$ s]	Jitter [ $\mu$ s]
4	sync.	75.69	6.58	71.53	2.70
	async.	75.07	39.19	84.79	33.81
2	sync.	31.90	5.50	31.37	3.25
	async.	32.83	6.19	30.31	15.57

- Both protocols have almost equally low latency (Latency  $< 100 \mu$ s)
- Synchronous traffic in TTE is most precise (Jitter  $< 4 \mu$ s)

- Both technologies are able to fulfill the requirements
  - for camera and multimedia traffic
  - for control traffic
- With the tree-based topology and today's amount of traffic flows the protocols perform almost equally well
- Light advantages for Ethernet AVB for multimedia and camera streams
- Light advantages for TTEthernet for control traffic

In our ongoing and future work we will ...

- ... analyse how cross-traffic will influence the performance of the backbone network
- ... analyse whether a backbone with coexistence of both concepts can improve performance and flexibility
  - Time-triggered traffic class and strict priority scheduling for control traffic
  - Credit based shaping and online stream reservation for multimedia streams
