**In collagenase blend enzymes which are
the key factors for isolation success?**

1st key factor:
The role of collagenase class I
and collagenase class II

Different Roles of Class I and Class II *Clostridium Histolyticum* Collagenase in Rat Pancreatic Islet Isolation

Gerrit H.J. Wolters, Greetje H. Vos-Scheperkeuter, Hun-Chi Lin, and Reinout van Schilfgaarde

Diabetes 44:227-233, 1995

Collagenase Class I:

- is highly active toward native collagen
- is ineffective to dissociate pancreatic tissue completely

Collagenase Class II:

- has a low affinity toward native collagen
- dissociates pancreatic tissue completely but slowly

Combining Class I and Class II:

- results in a rapid and complete dissociation of pancreatic tissue
- indicates that Class II plays the major role and Class I the supporting role

Adjustment of the Ratio Between Collagenase Class II and I Improves Islet Isolation Outcome

D. Brandhorst, S. Huettler, A. Alt, N. Raemsch-Guenther, M. Kurfuerst, R.G. Bretzel, and H. Brandhorst

Transplantation Proceedings, 37, 3450–3451 (2005)

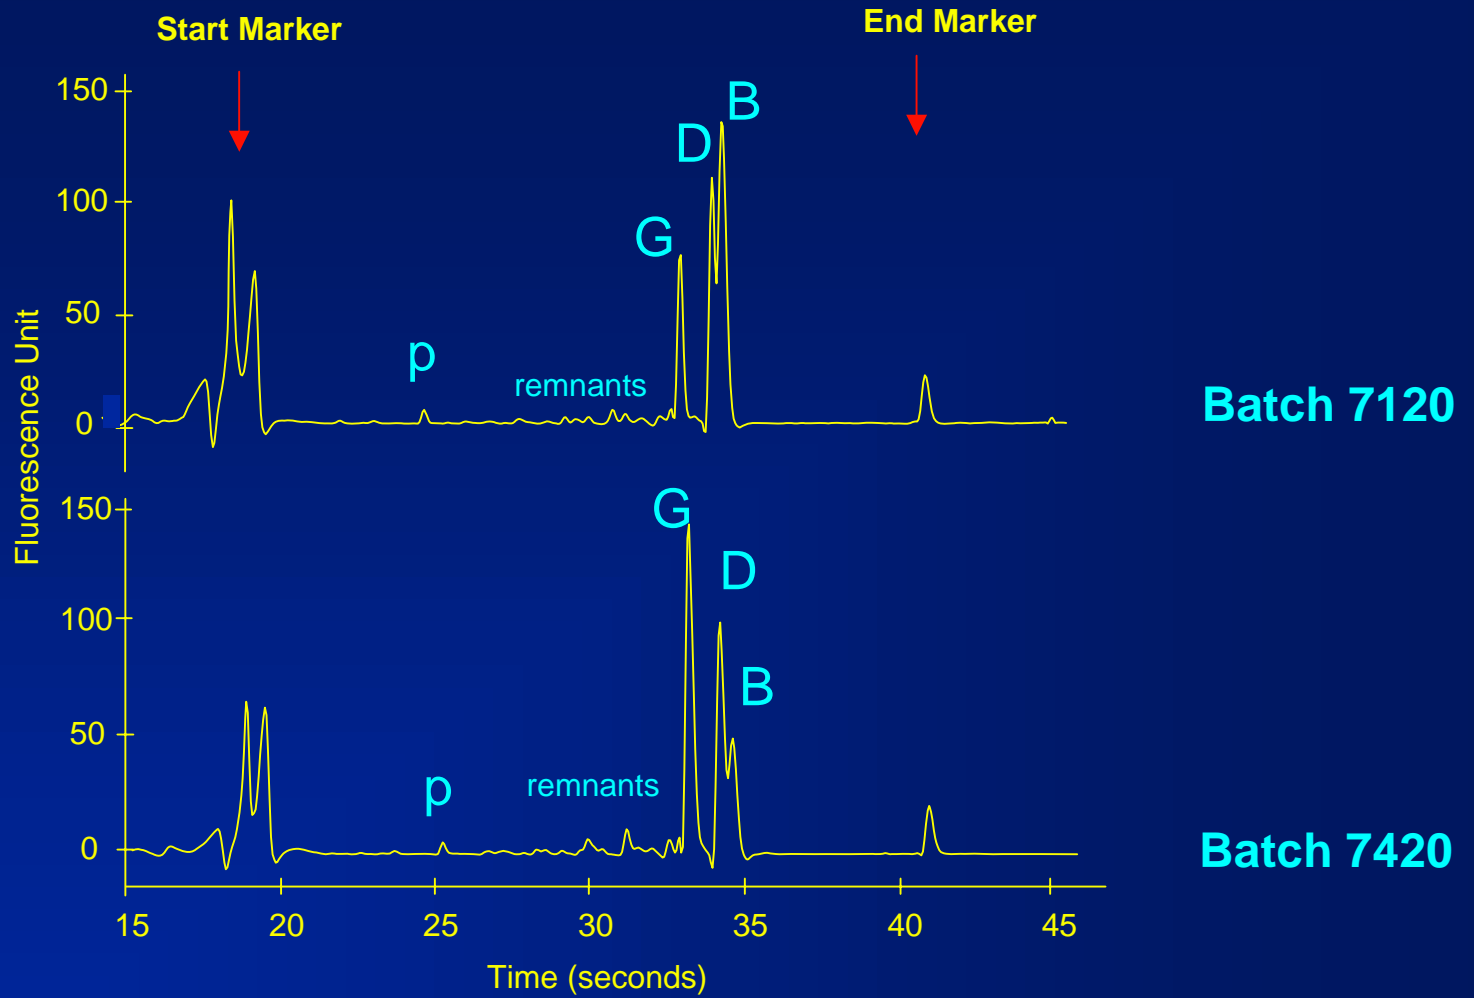

Table 1. Rat Islet Isolation Outcome Utilizing Different Ratios Between Collagenase Class II (cclII) and Class I (cclI)

cclII Ratio	n	Digestion (min)	Yield (IEQ/Rat)	Purity (%)	Viability (%)	Stimulation Index (20 mmol/L/2.8 mmol/L)	Transplant Survival After 32 days (n/n)
0.5	9	19 ± 0.3*	2090 ± 160*	83 ± 3	93 ± 3*	1.4 ± 0.2	7/7
1.0	7	20 ± 0.4	2730 ± 280	85 ± 6	100 ± 1	1.5 ± 0.2	6/6
1.5	7	19 ± 0.6	1960 ± 170*	84 ± 2	92 ± 2**	1.5 ± 0.2	6/6

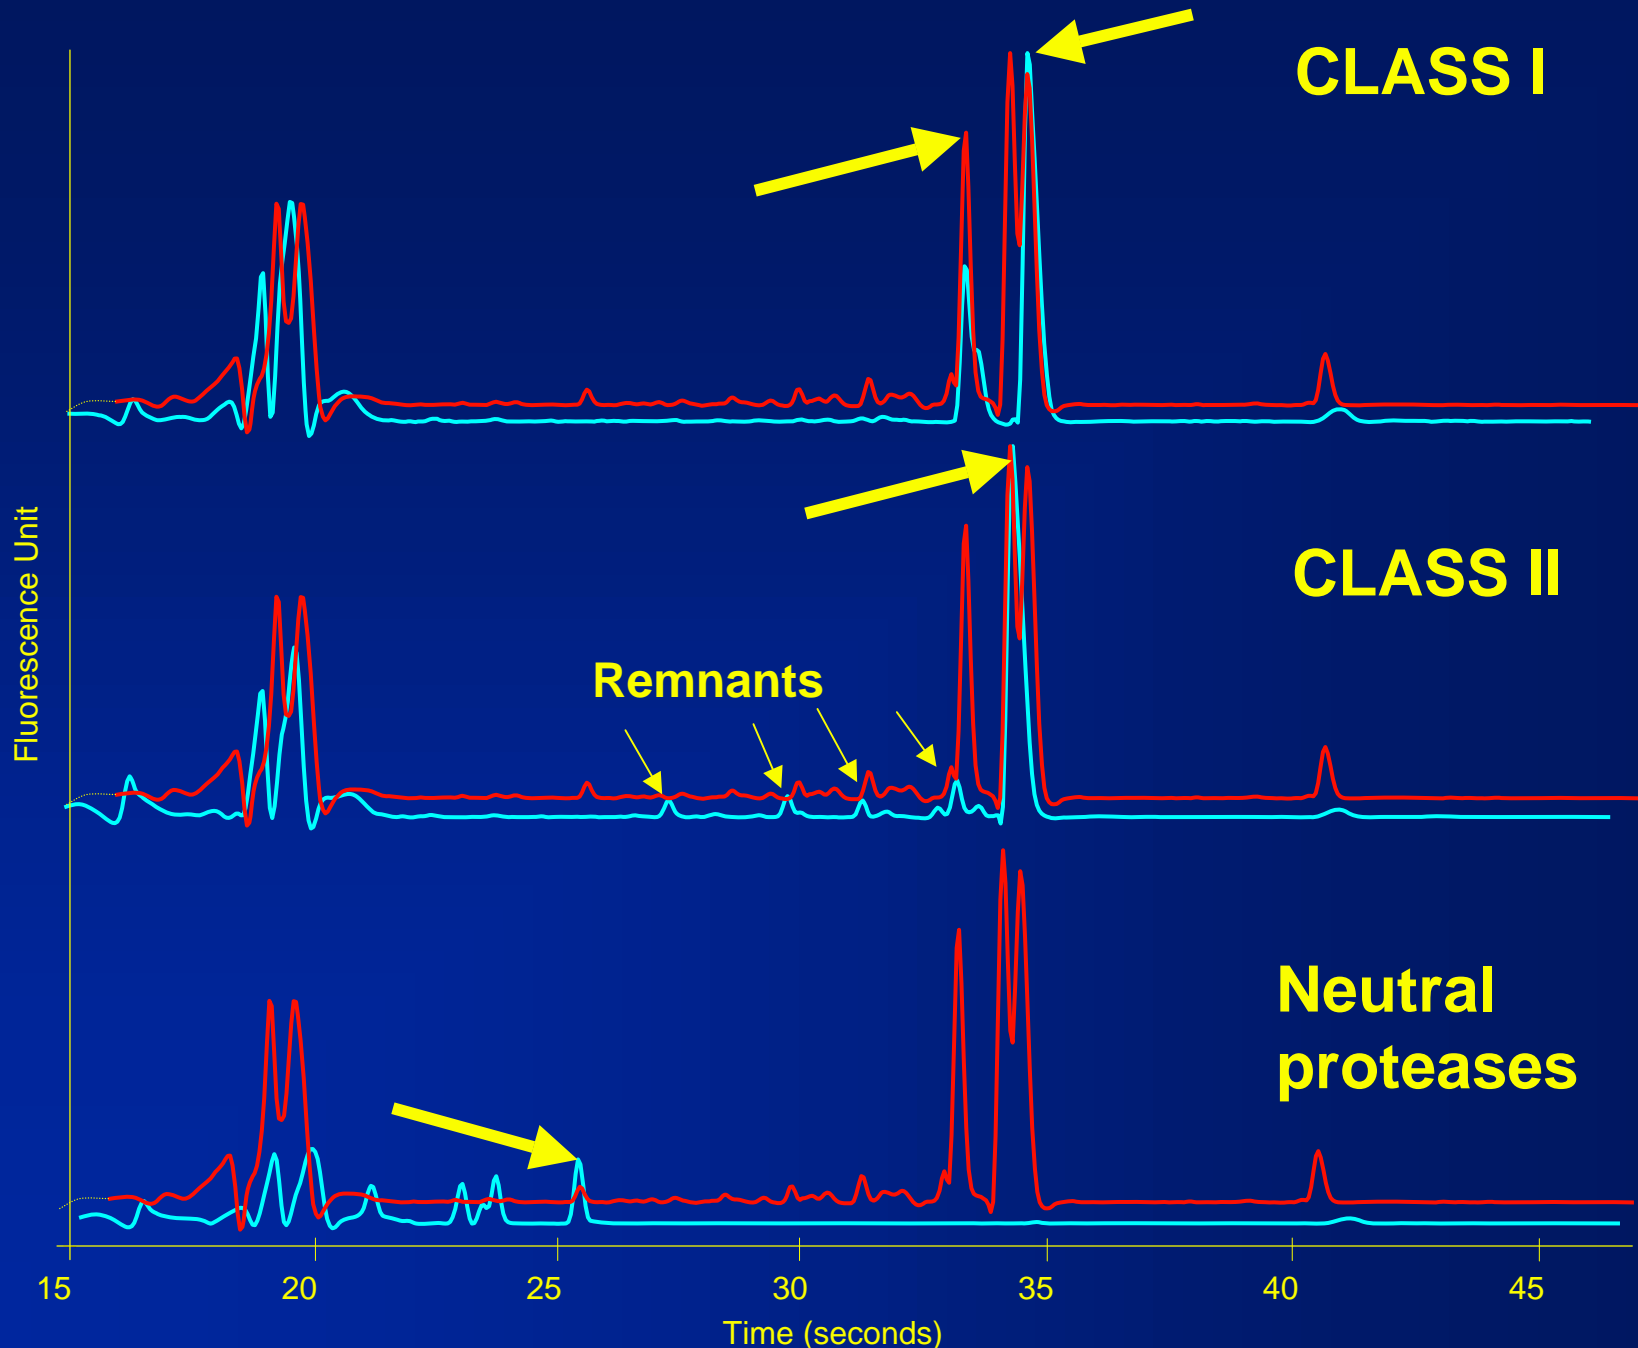

Data are means ± SEM.

* $P < .05$.

** $P < .01$ vs a cclII ratio of 1.0 by Mann-Whitney test.

(Microelectrophoresis –Agilent Technology)

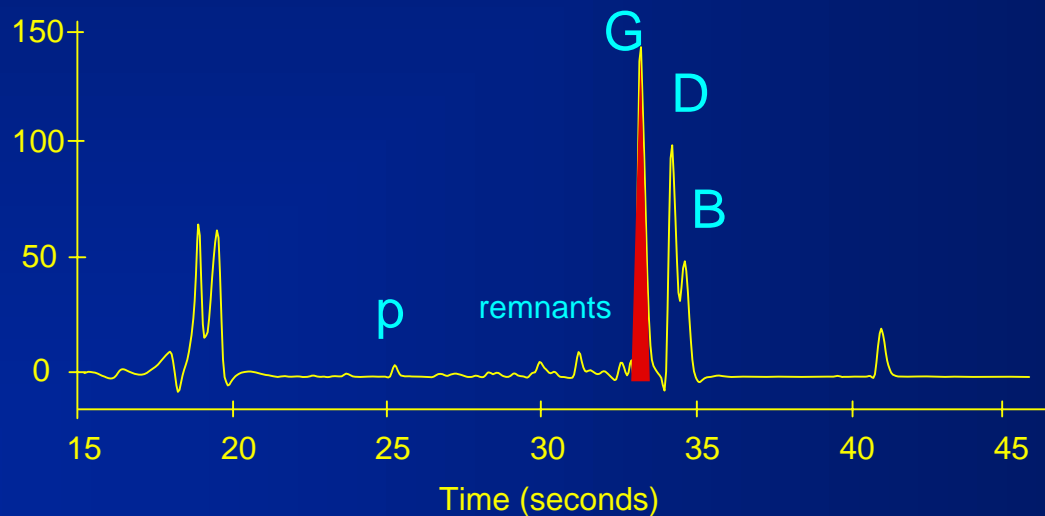

Has the relative presence of each enzyme
a role in the isolation success rate?

Index value:

relative area under the curve of each peak

(area of each peak/sum of areas of all peaks)

Collagenase class II

NE

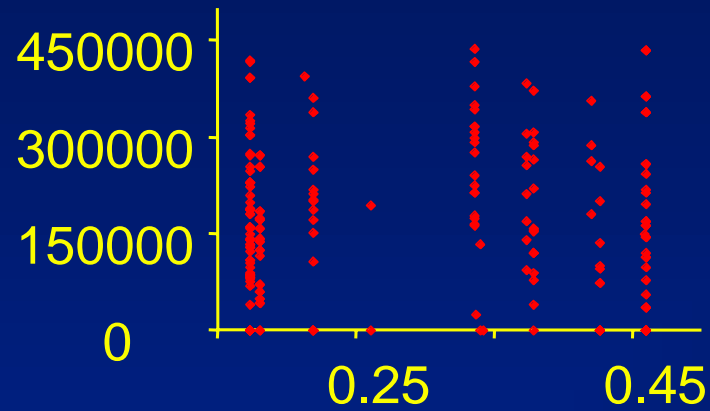

Digestion time

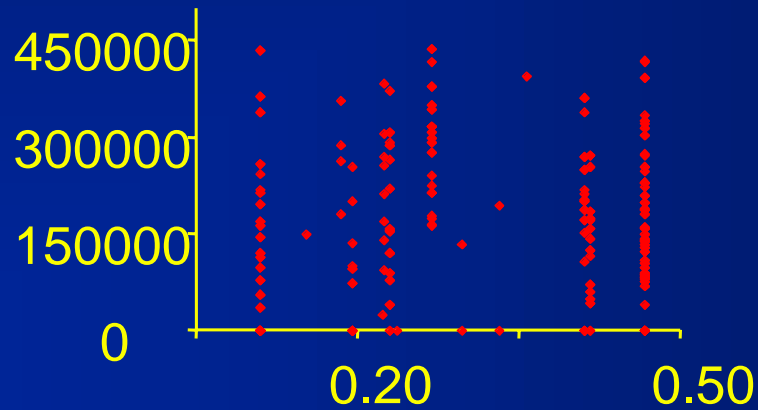

N=146 isolations of human pancreas

Collagenase class I

NE

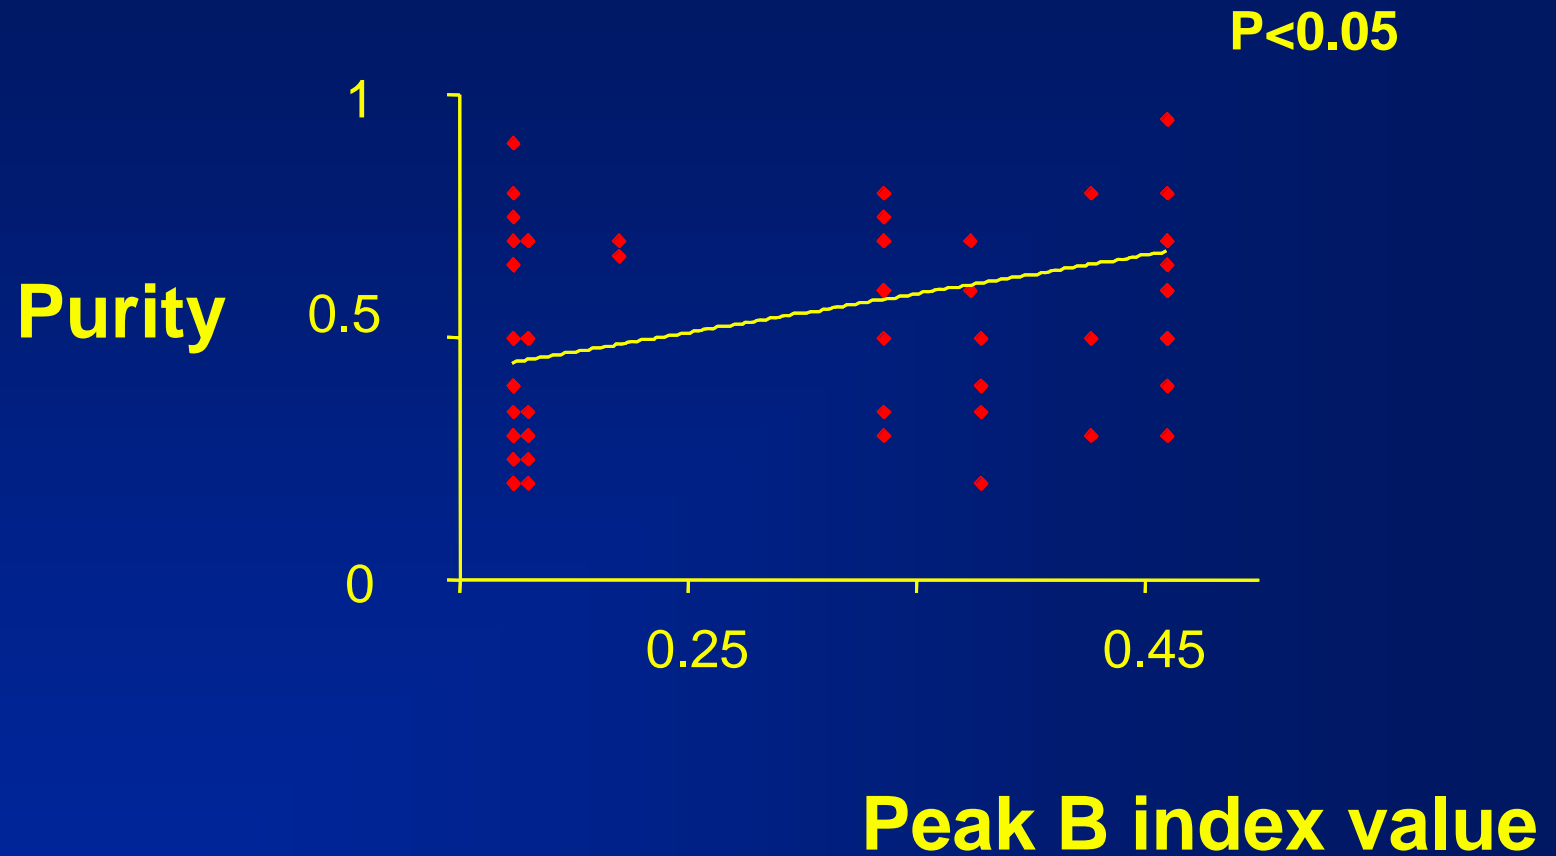

peak B

peak G

index value

Collagenase class I

Class II is the most important component of a collagenase blend

Class I peak B (the component with higher molecular weight) contributes to isolate successful islet preparations

If we consider isolations in which Liberase had
CII index values ≥ 50 percentile

33 out 98 were transplanted (about 1 out 3)

CII index values < 50 percentile

9 out 65 were transplanted (about 1 out 7)

(χ^2 test, $p=0.005$).

CII and CI (B) index values ≥ 50 percentile

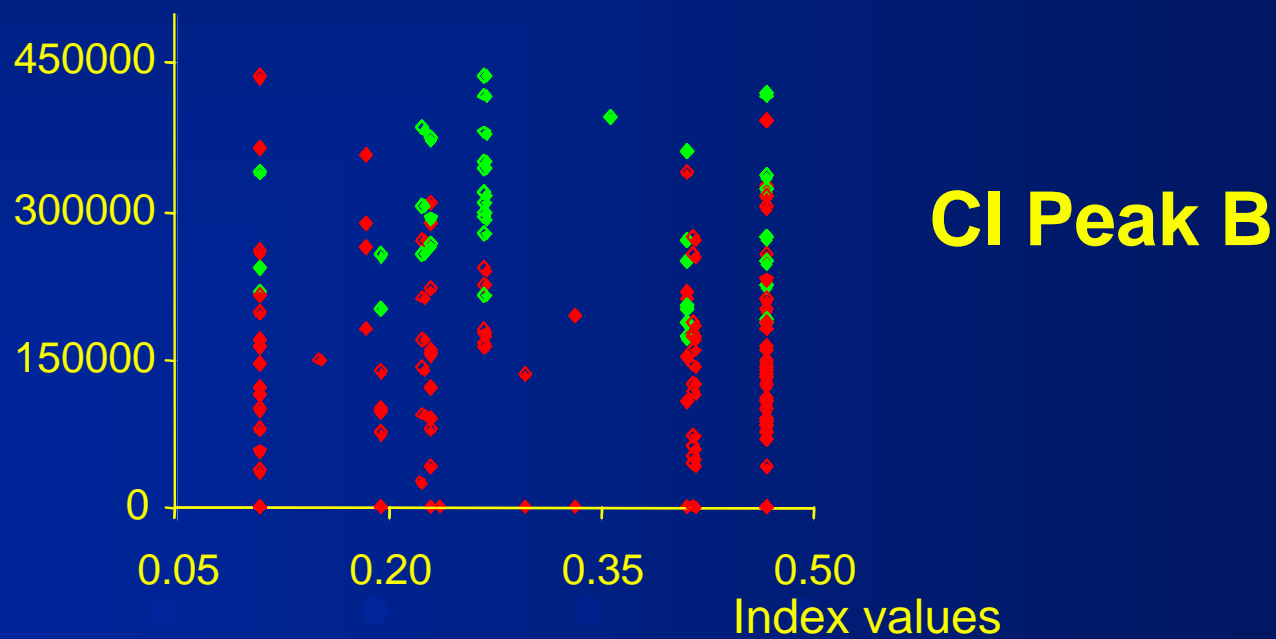

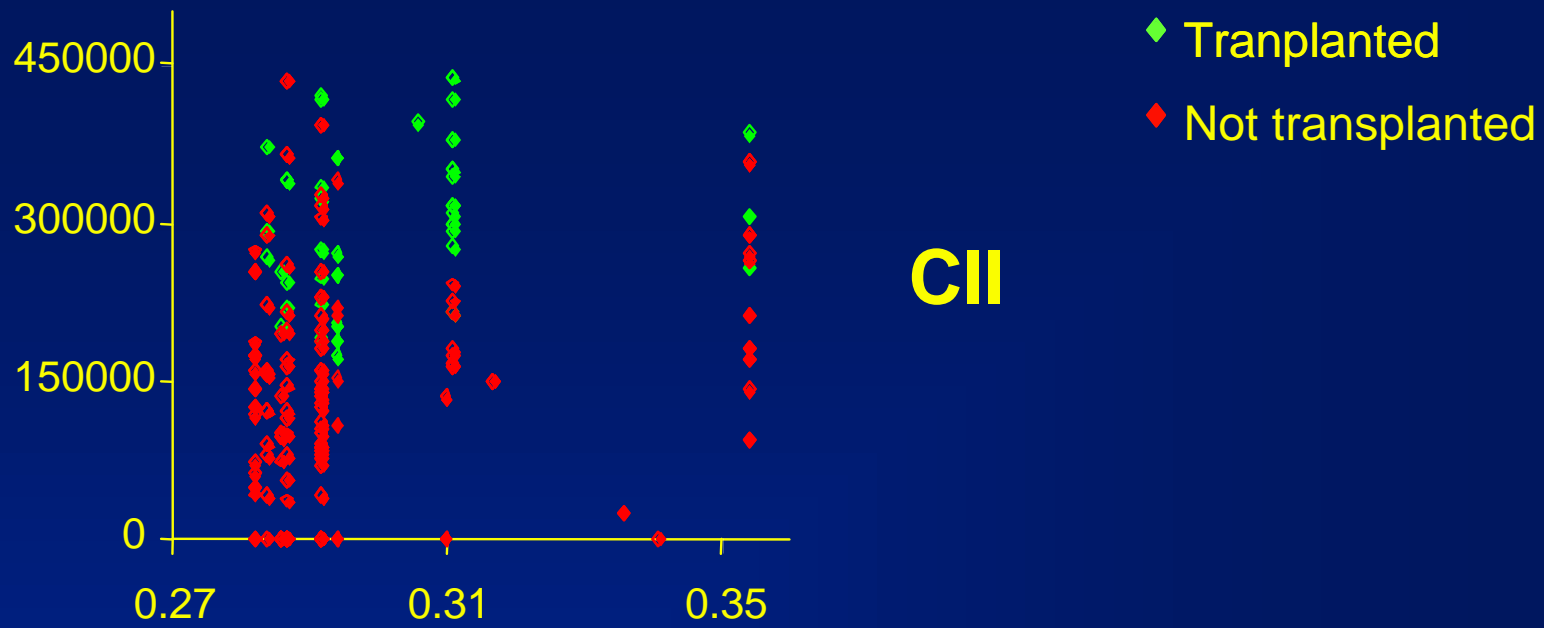

15 out 36 were transplanted (about 1 out 2)

CII and CI (B) index values < 50 percentile

27 out 127 were transplanted (about 1 out 5)

(χ^2 test, $p=0.013$).

Should we really use collagenase blend enzymes with higher as possible collagenase class I (peak B) and collagenase class II content?

From our data:

Class II collagenase remains the most important component of an enzyme.

CII percentage has to be limited to 29.5-31% as well as CI peak B to 20-35%.

As consequence the remaining enzyme has to be represented by CI peak G ($\cong 25\%$).

Additional consideration:

Class II is the most important component of a collagenase blend.

A proper evaluation of its role in pancreas digestion should take in account other variables of isolation procedures.

Islet isolation for allotransplantation: variables associated with successful islet yield and graft function

require standardisation. *Methods:* Since 1989 we have processed 437 pancreases using the automated method. The donor characteristics, pancreas procurement, and digestion and purification procedures including a wide enzyme characterisation of these pancreases were analysed and correlated with islet yield and transplant outcome. *Results:* By

0.0029). A statistically significant contribution to the variability of islet yield in a multivariate analysis performed on donor variables was found for donor BMI ($p=0.0008$). In a multivariate analysis performed on pancreas variables a contribution was found for pancreas weight ($p=0.0064$), and for a multivariate analysis performed on digestion variables we found a contribution for digestion time ($p=0.0048$) and total collagenase activity ($p=0.0001$). **2nd key factor:
the role of neutral proteases**

An analysis of the role of collagenase and protease in the enzymatic dissociation of the rat pancreas for islet isolation

G.H.J. Wolters, G.H. Vos-Scheperkeuter, J.H.M. van Deijnen and R. van Schilfgaarde

Department of Surgery, University of Groningen, Groningen, The Netherlands

Neutral Protease:

- detrimental for islet integrity
- essential for initial collagen degradation

Collagenase:

- essential for final collagen degradation
- non-toxic to islets
- if singly used ineffective

Effect of protease concentration on pancreas dissociation time.

Brandhorst H, Brendel MD, Eckhard M, Bretzel RG, Brandhorst D.

Influence of neutral protease activity on human islet isolation outcome.

Transplant Proc. 2005 Jan-Feb;37(1):241-2.

Brandhorst H, Alt A, Huettler S, Raemsch-Guenther N, Kurfuerst M, Bretzel RG, Brandhorst D.

The ratio between class II and class I collagenase determines the amount of neutral protease activity required for efficient islet release from the rat pancreas.

Transplant Proc. 2005 Jan-Feb;37(1):215-6.

Formulation Analysis by HPLC

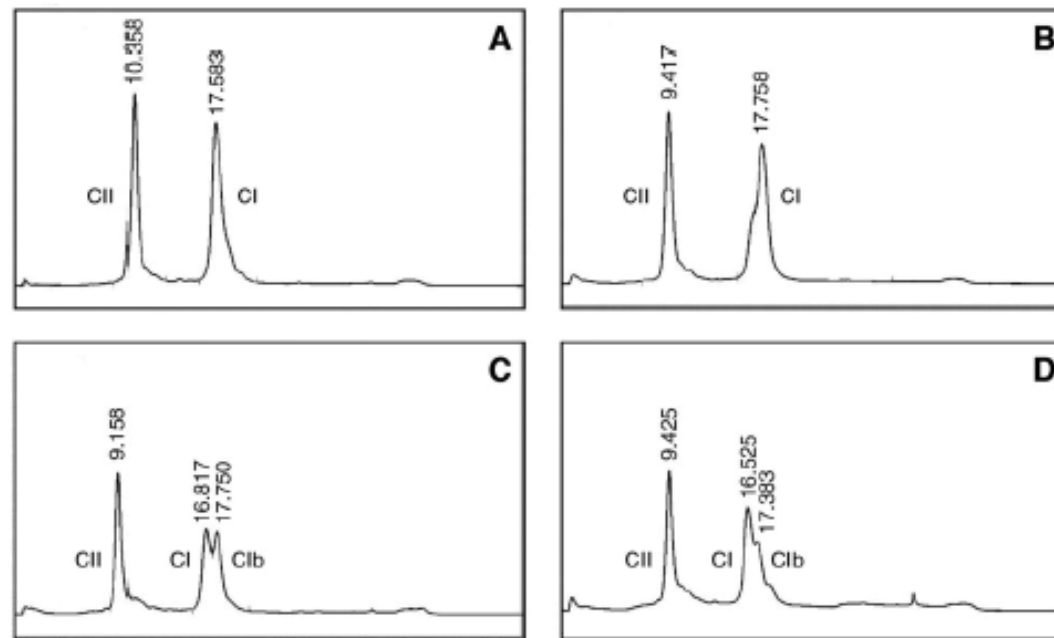

FIGURE 1. Chromatograms of Liberase HI. (A) Lot 93080820. (B) Lot 93096820 with a peak shoulder. (C–D) These lots (93131620 and 93134620 respectively) had distinct proportions of CIb.

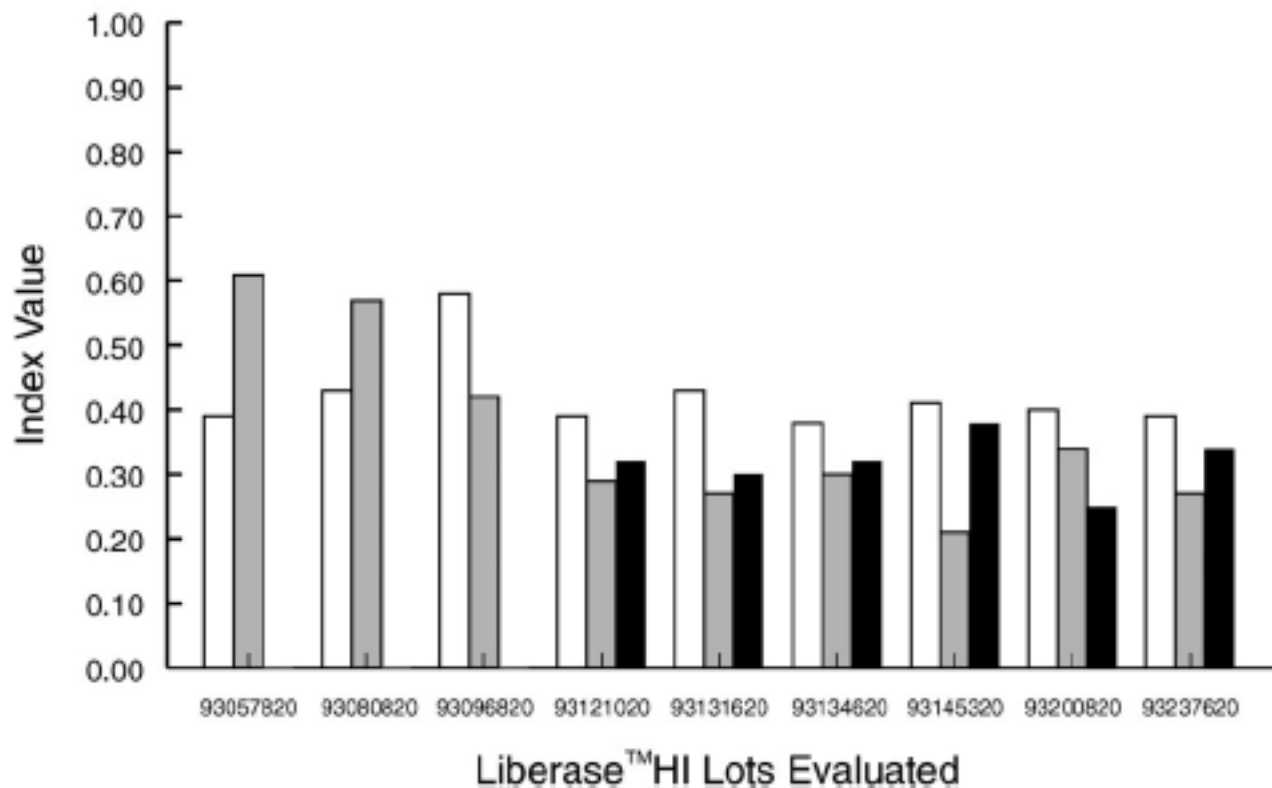

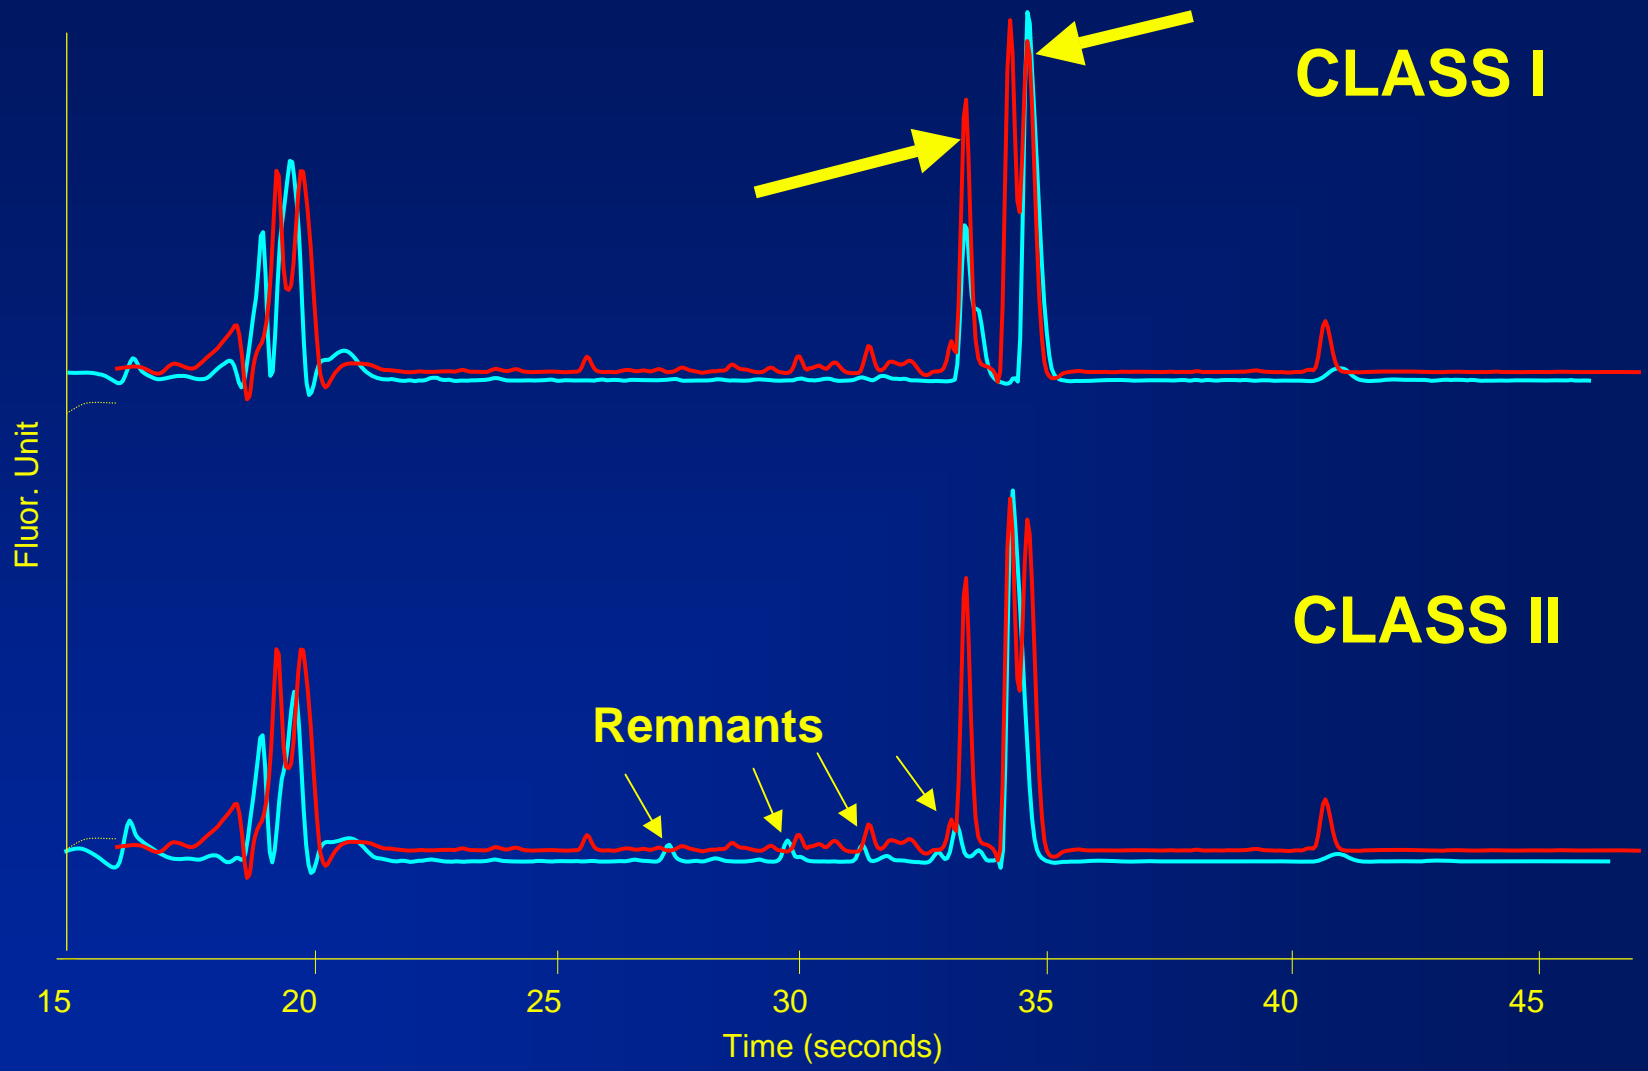

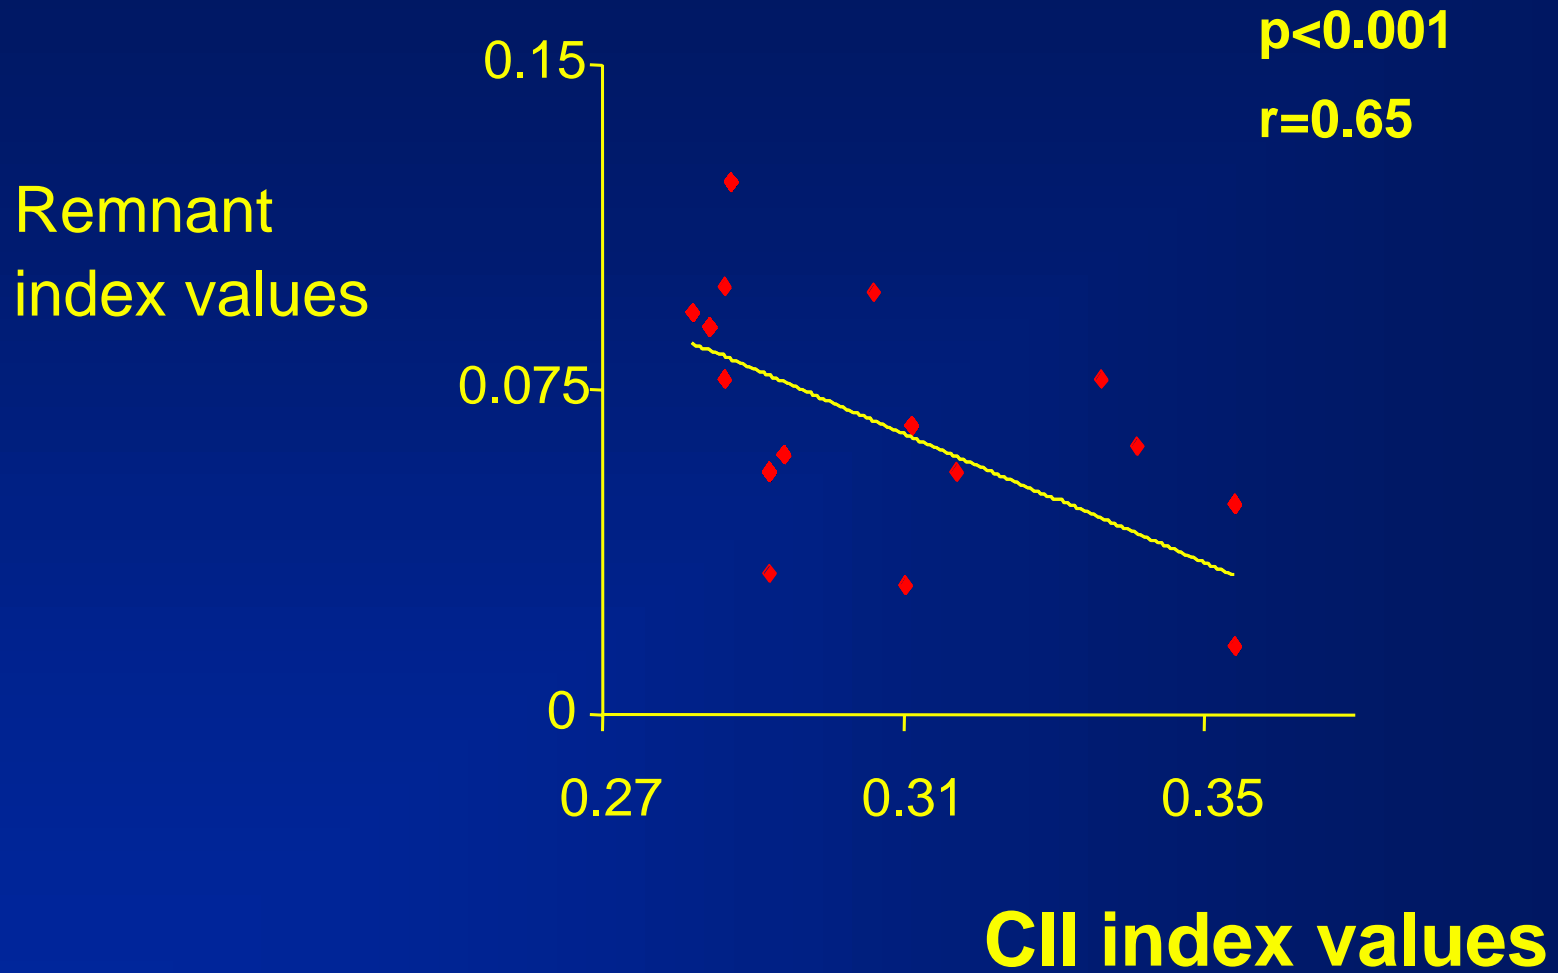

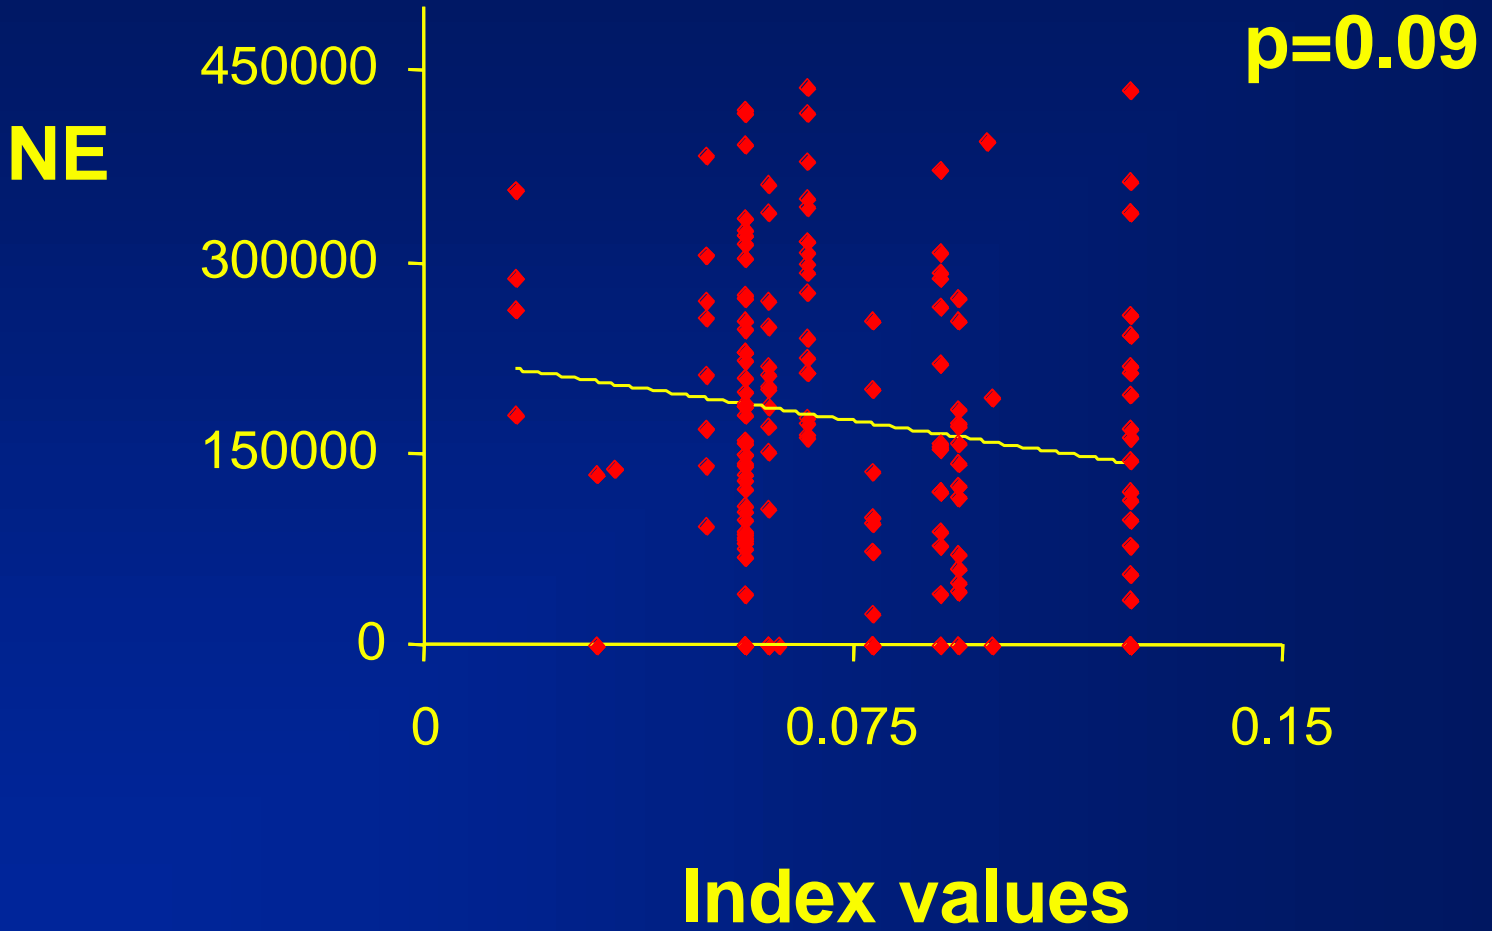

FIGURE 2. The plot of the relative index for each of CII (□), CI (▒), and Clb (■). The appearance of detectable Clb was closely related to the chronology of manufacture. The data suggests, that if Clb is a degradative product, its appearance in the blend may be related to a change in relative enzyme potency.

Class I collagenase β (115 kDa) α (68 kDa) γ (79 kDa)

New isoform or degradation product?

Sequentied peptides are in bold

Further studies should be aimed at:

- 1) Improving enzymatic blend purification in order to separate peak B from peak G of collagenase class I.
- 2) Improving enzymatic blend stability in order to avoid degradation products.
- 3) Testing the activity of each enzymatic blend component toward the most important collagen types present in human pancreas (I, IV and VI).
- 4) Producing each enzymatic blend component by recombinant technique on the bases of the new data available for definitive standardization of isolation.

Thank you for your attention!
