## Welcome

- **Stephen L. Smith** received a BSc in Computer Science and then an MSc and PhD in Electronic Engineering from the University of Kent, UK. He is currently a senior lecturer in the Department of Electronics at the University of York, UK.
- Steve's main research interests are in developing novel representations of evolutionary algorithms particularly with application to problems in medicine. His work is currently centered on the diagnosis of neurological dysfunction and analysis of mammograms.
- Steve is co-founder and organizer of the MedGEC Workshop, which is now in its ninth year. He is also guest editor for a special issue of Genetic Programming and Evolvable Machines (Springer) on medical applications and co-editor of a book on the subject (John Wiley, November 2010).
- Steve is associate editor for the journal Genetic Programming and Evolvable Machines and a member of the editorial board for the International Journal of Computers in Healthcare and Neural Computing and Applications.

## The City of York

## The University of York

## The University of York

## Overview

- Introduction to medical applications of EC
  - how these differ from other real-world applications
- Overview of previous work
  - from a medical and EC point of view
- Case examples of medical applications
- Practical advice on how to get started
  - choosing an application and obtaining good data
- Summary

## Overview

- Introduction
- Previous work
- Why consider a medical application?
- Choosing a Medical Application
- Data sets
- Choice of evolutionary algorithm
- Data input, output and fitness function
- Case examples
- Getting started

## Introduction

- Challenging application area
  - often no reliable “ground truth” or “gold standard”
  - access to data difficult
  - multiple ethical considerations
- Opportunities
  - unexplored territory
  - funding and publications
  - make a difference

## Previous Work

- Medical Imaging and Signal Processing
- Data Mining Medical Data and Patient Records
- Modelling and Simulation of Medical Processes
- Clinical Expert Systems and Knowledge-based Systems
- Clinical Diagnosis and Therapy

## Medical Imaging and Signal Processing

Ballerini and Bocchi [1]

- Automated image segmentation
- Bone age assessment
  - to detect abnormality in skeletal growth
- Multiple genetic snakes
  - planar active contours optimised by GAs
  - elastic force connects adjacent snakes

Source: Ballerini and Bocchi [1]

## Medical Imaging and Signal Processing

Mañana, González and Romero [2]

- Image Registration
- Intra-oral radiographs
- Distributed adaptive GA
  - to find an optimal affine
- Genome
  - 4 floating point numbers
    - scale factor
    - rotational angle
    - X & Y translations

Source: Mañana, González and Romero [2]

## Data Mining Medical Data and Patient Records

Ghannad-Rezaie *et al.* [3]

- Surgery candidate selection
  - for temporal lobe epilepsy
  - integrates a classifier with a particle swarm algorithm (PSO)
- Compared with:
  - ant colony optimisation (ACO)
  - Bayesian Belief Network (BBN)
  - C4.5 (a decision tree approach)
  - LOcal LInear MOdel Tree (LOLIMOT)

Source: Ghannad-Rezaie *et al.* [3]

## Modelling and Simulation of Medical Processes

Bosman and Alderliesten [4]

- Medical simulation
  - for minimally invasive vascular intervention
  - used to train clinicians
- Minimisation of energy
  - associated with trajectory of guide wire
  - iterative density estimation evolutionary
  - accurate and closer to real-time simulation of the intervention

Source: Bosman and Alderliesten [4]

## Clinical Expert Systems and Knowledge-based Systems

Koutsojannis and Hatzilygeroudis [5]

- Diagnosis and treatment of blood gas disturbances
  - observed in intensive care unit patients
- Fuzzy expert system incorporating an EA
  - differential EA fine-tunes membership functions of the fuzzy variables

Source: Koutsojannis and Hatzilygeroudis [5]

## Why Consider a Medical Application?

- Interesting
  - real problems
  - potential to help real people
  - cross-disciplinary collaborations
- Good source of funding
  - government
  - charities
  - commercialization opportunities
- Good for publications
  - exploit both engineering and medical literatures

## Choosing a Medical Application

- Review the field
  - through the medical and engineering literature
- Choose a *novel* application area
  - with a clinical need (medical or financial!)
- Contact a health professional
  - go and talk to them
- Evaluate the scope for obtaining data
  - and a “gold standard” or “ground truth”

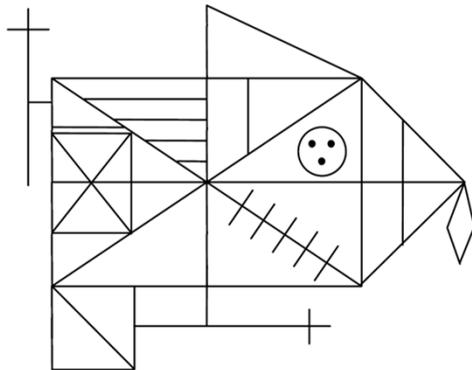

## Datasets

- The performance of any evolutionary algorithm is only as good as the data it is trained on
  - often no definitive clinical test for condition under investigation
  - datasets usually involve subjective clinical assessment
  - often have missing or corrupted values
    - resulting in insufficient good data for statistical
    - can be ameliorated by the use of k-fold cross-validation

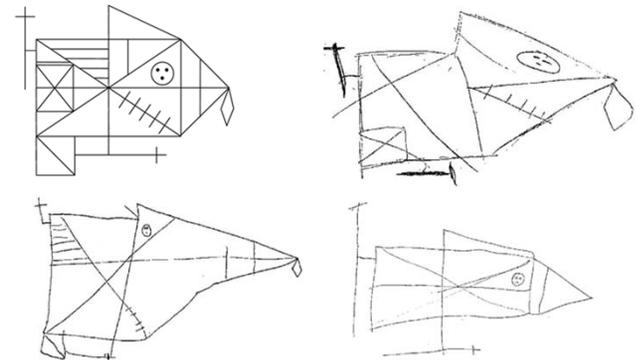

## Datasets

- When subjective evaluation is involved:
  - engage multiple assessors
    - to provide greater confidence
  - agree a consistent marking protocol
    - several standards usually in use
  - gather data from multiple sites
    - to compensate for local marking practice
    - to sample representative demographic population
- Engage a health statistician **before** you start

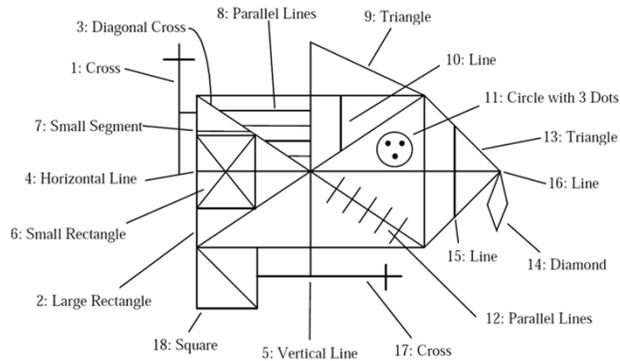

## Complex Figure Copying Test

## Example Patient Drawings

## Subjective Mark Scheme

## Choice of Evolutionary Algorithm

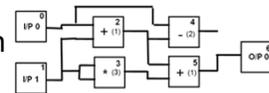

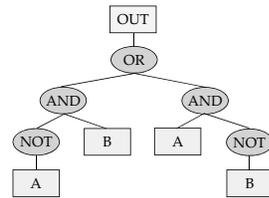

- Many to choose from
- Choice often based on:
  - previous experience
  - match to data representation
  - performance in previous similar applications
- Consider conventional statistical analysis
  - comparison of performance
  - justification for the use of an EA
  - understand the nature of the data
- Ensembles of EAs have potential

## Cartesian Genetic Programming (CGP)

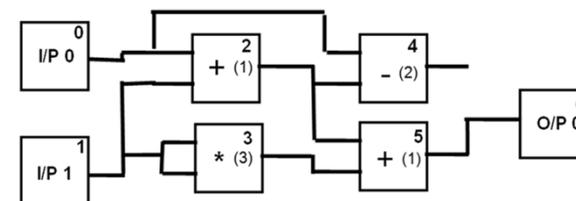

- Form of genetic programming
  - originators Miller and Thomson (1997)

- Genotype is a list of integers
  - that represent the program elements
  - how they are connected together

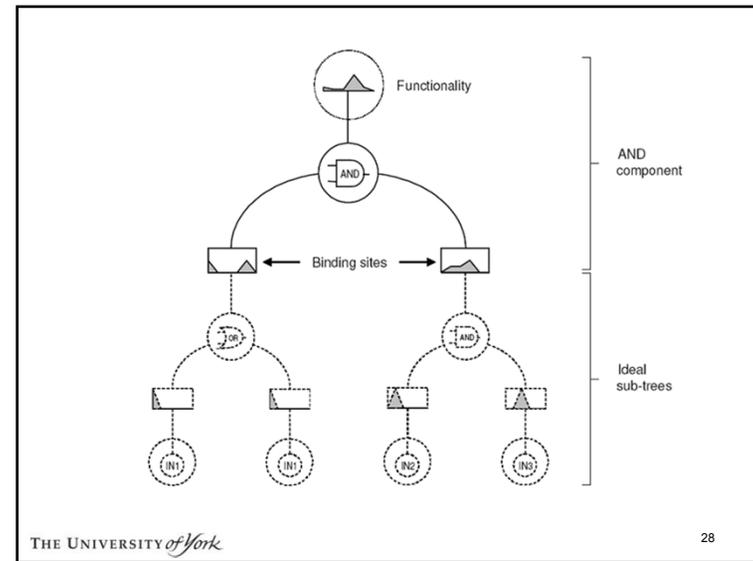

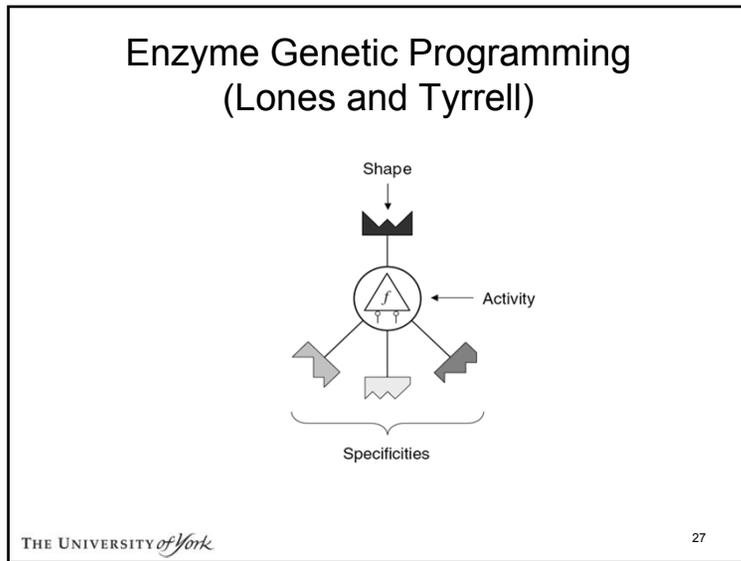

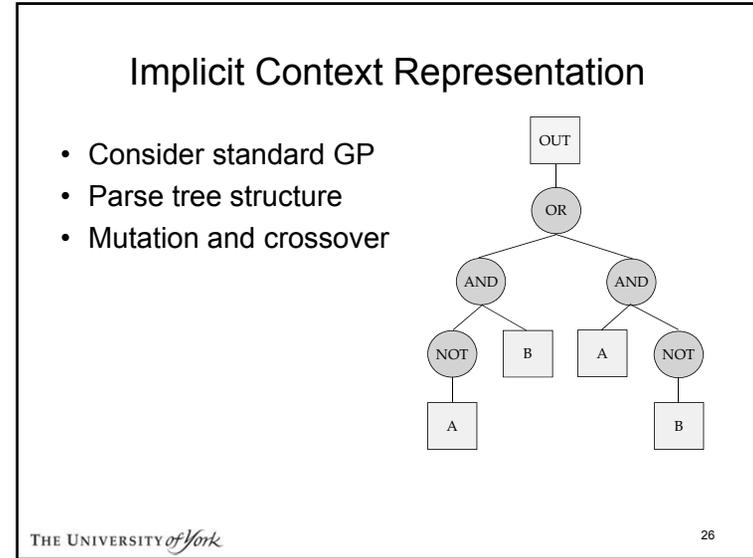

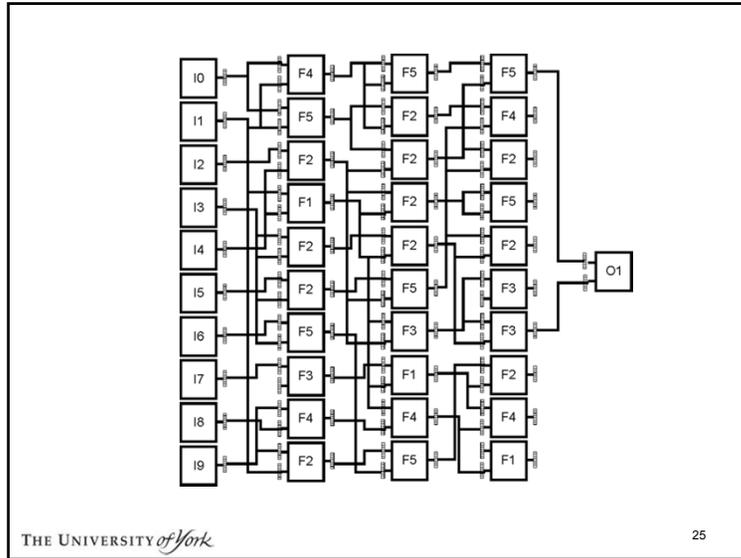

- Representation a directed graph
  - simple, flexible and convenient for many problems

## Example CGP Network

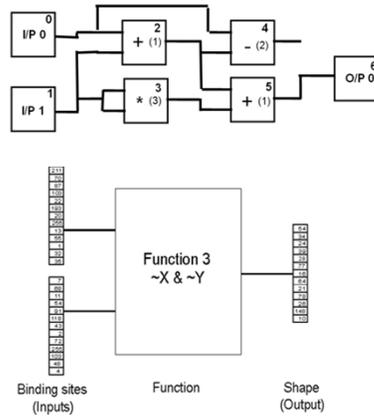

0 1 1 1 3 0 2 2 2 3 1 5

## Implicit Context Representation for CGP

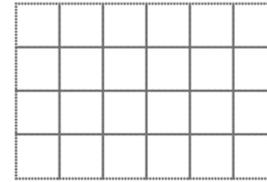

Mutation of components'

O1

Available Components

## Formation of Network

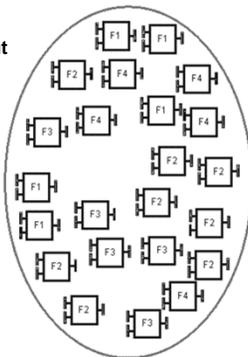

Inputs

Output

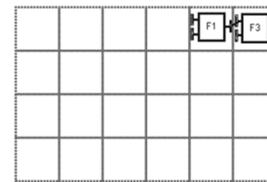

O1

Available Components

## Fitness Function

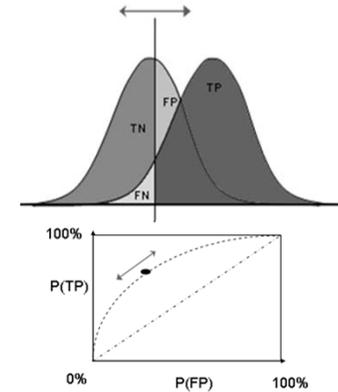

- In clinical studies often based on sensitivity and specificity
  - sensitivity =  $TP/P$
  - specificity =  $TN/N$

Where:

TP number of true positive instances correctly classified  
 TN number of true negative instances correctly classified  
 P is number of positive instances that truly exist  
 N is number of negative instances that truly exist

## Choice of Threshold Value

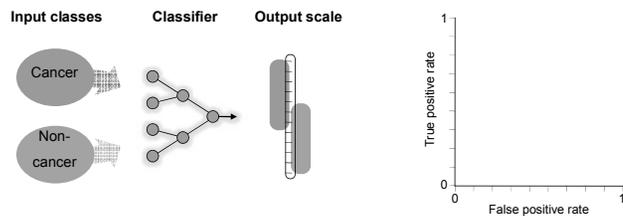

- Can be used to weight classification
- According to the cost associated with a misclassification
- Often summarised using ROC curves

kakau. Released under the GNU Free Documentation License.

## ROC Analysis

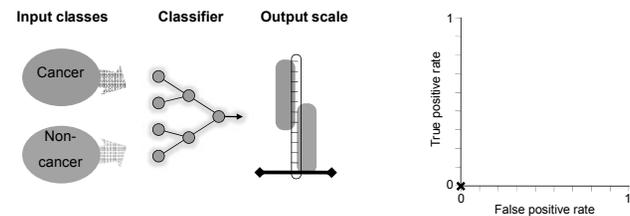

- Receiver Operating Characteristic (ROC) curves:

Slide: Mic Lones

## ROC Analysis

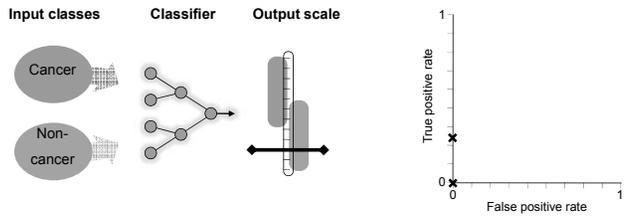

- Receiver Operating Characteristic (ROC) curves:

Slide: Mic Lones

## ROC Analysis

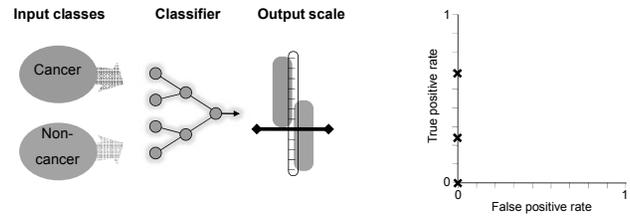

- Receiver Operating Characteristic (ROC) curves:

Slide: Mic Lones

## ROC Analysis

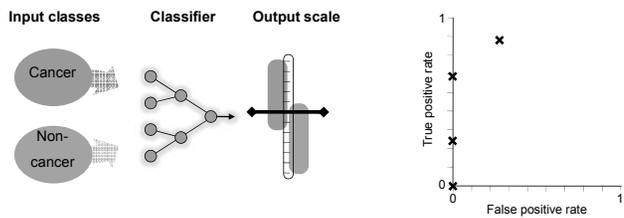

- Receiver Operating Characteristic (ROC) curves:

- Area Under Curve (AUC)
  - Probability of ranking a class member higher than a non-member
  - i.e.  $p[C(\text{cancer}) > C(\text{non-cancer})]$

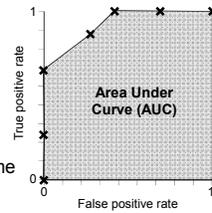

Slide: Mic Lones

## ROC Analysis

- Receiver Operating Characteristic (ROC) curves:

- Area Under Curve (AUC)

- Probability of ranking a class member higher than a non-member
    - i.e.  $p[ C(\text{cancer}) > C(\text{non-cancer}) ]$
    - AUC of 0.5 equivalent to random classification
    - A classifier with  $AUC = n$  has the same power as one with  $AUC = 1-n$
    - AUCs recently attracted criticism

Slide: Mic Lones

## ROC Analysis

- Multi-class ROC analysis:

- Hand and Till, 2001:

$$AUC_{\text{multiclass}} = \frac{2}{|C|(|C|-1)} \sum_{\{c_i, c_j\} \in C} AUC(c_i, c_j)$$

- $\approx$  mean of AUCs for each pair of classes
    - Direction of AUCs ( $>$  or  $<$  0.5) is important
      - i.e. must separate classes in the correct order

D. Hand and R. Till. A simple generalization of the area under the ROC curve to multiple class classification problems. *Machine Learning*, 45(2):171-186, 2001.

## Case Example 1: Breast Cancer

([www.breastcanceruk.org.uk/statistics/2004-6](http://www.breastcanceruk.org.uk/statistics/2004-6))

- 207,000 women diagnosed in the US in 2010
  - 40,000 died as a result of the disease
- 1 in 9 women will suffer from breast cancer at some time in their life
- Most commonly diagnosed cancer in women under the age of 35
- Accounts for some 25% of all cancer cases in women worldwide

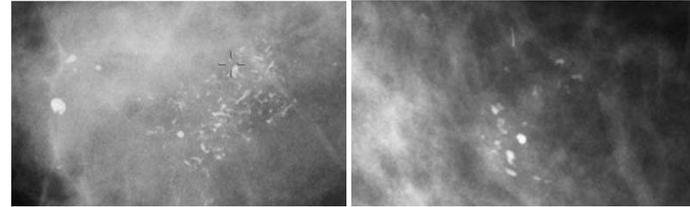

## Mammograms

- Assessed subjectively
- Size, shape and texture of
  - microcalcifications
  - spiculated masses

## Microcalcifications

- Calcium deposits
  - secretions from ductal structures
- Occur in clusters
- 40-50% cancerous
- Discriminated by:
  - shape
  - size
  - texture
  - distribution

## Microcalcifications

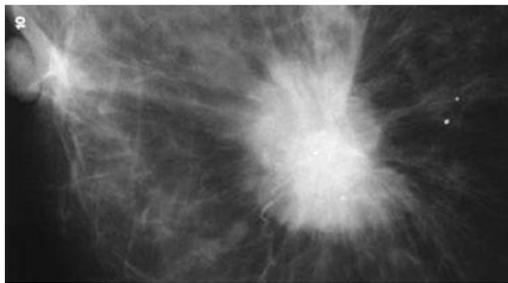

Example cluster of malignant microcalcifications

Example cluster of benign microcalcifications

(Images courtesy of the *Radiology Assistant*: [www.radiologyassistant.nl](http://www.radiologyassistant.nl))

## Spiculated Masses

Example spiculated mass

(Image courtesy of the *Radiology Assistant*: [www.radiologyassistant.nl](http://www.radiologyassistant.nl))

## Datasets

- Several publically available datasets of mammograms
  - Mammographic Image Analysis Society (MIAS) Database
  - University of South Florida Digital Mammography Database (USFDMD)
  - Lawrence Livermore/University of California (LLNL/UCSF) Database
- Many privately constructed datasets

## Datasets

- All have their disadvantages
- Lack consistency in:
  - classification
  - demographic spread
  - diagnosis
  - supporting diagnostic information
  - digitization
  - resolution
  - file format

## Using Existing Datasets

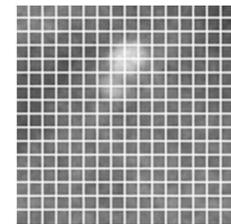

- Using other peoples datasets may have implications!
- LLNL/UCSF database
- From “Somewhere in England”

## Constructing a New Dataset

- Requires:
  - clinical cooperation
  - authority
  - suitable software tools
    - especially, the user interface

## Regions of Interest (ROI)

- Regions showing microcalcifications are identified (128x128 pixel)
- These are divided into smaller sections called ‘parts’ (8x8 pixels)

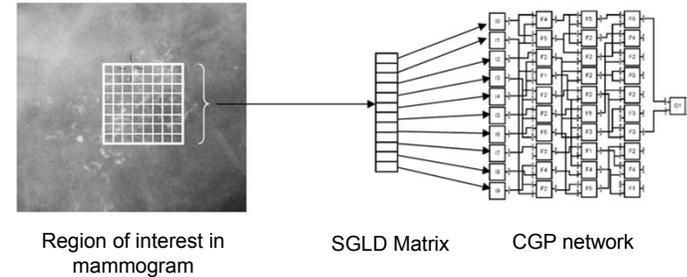

8x8 pixels

## Application of CGP

- CGP as an optimizer
- CGP as a feature extractor and classifier

## CGP as an Optimizer

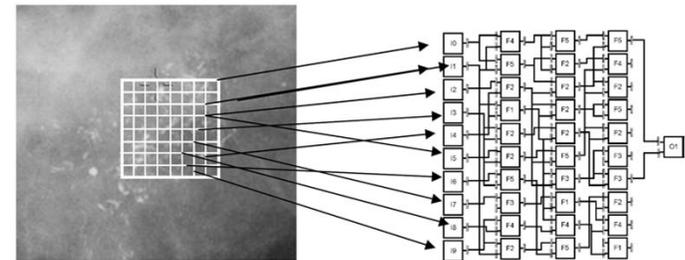

Hope, Smith and Munday [6]

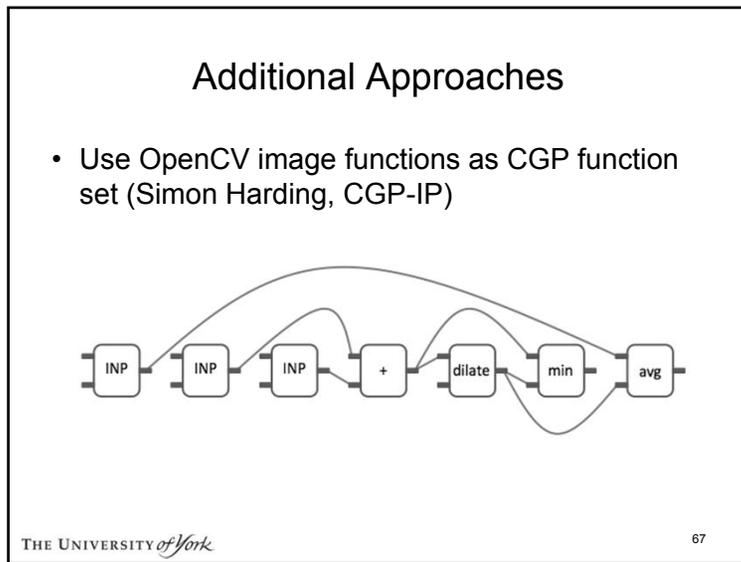

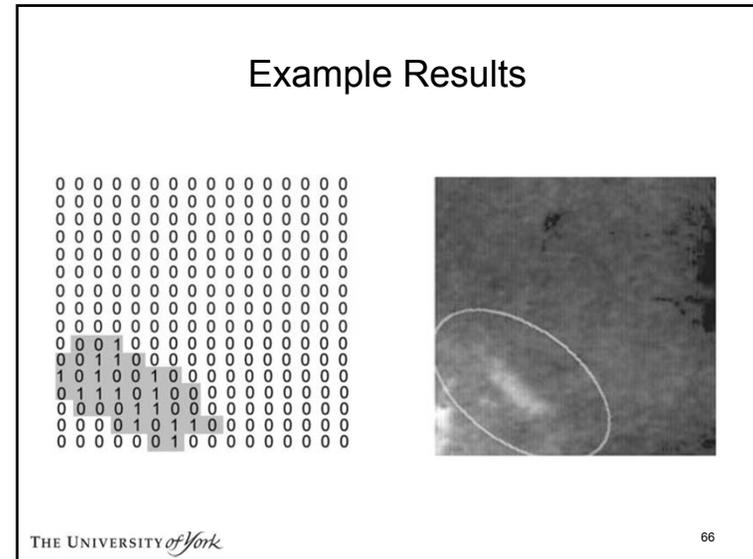

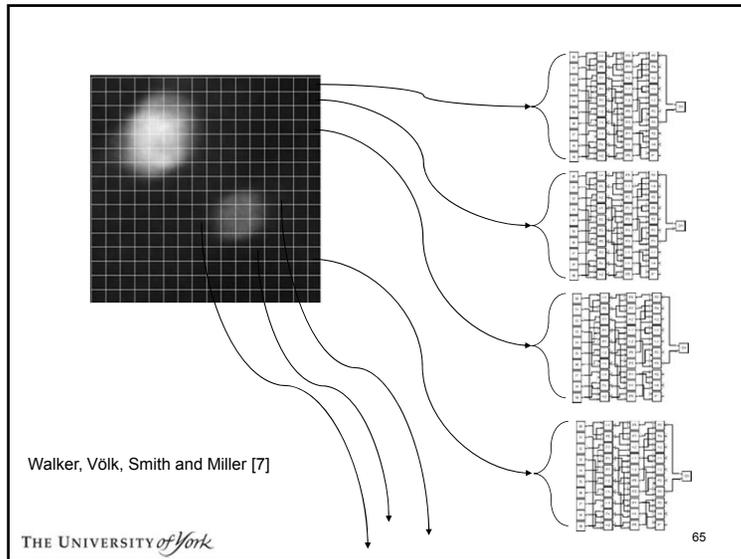

## Spatial Gray Level Dependence Matrix

- Also known as spatial gray co-occurrence matrix
- Considers positional information of pixels
- Following features from the SGLD matrices
  - at  $45^\circ$ ,  $90^\circ$ ,  $135^\circ$  and  $180^\circ$
  - maximum value
  - second moment
  - third moment

## CGP as Feature Extractor and Classifier

- ### Case Example 2: Parkinson's Disease
- Common, chronic, progressive neurodegenerative brain disease
  - Affects the control of muscles
  - Incidence of 1 person in 1000
    - about 1 person in 100 over the age of 60
  - Insufficient formation and action of dopamine
- THE UNIVERSITY of York
- 68

## Primary Symptoms of Parkinson's Disease

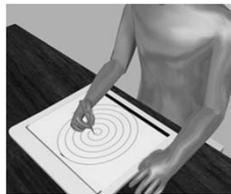

- Tremor
  - 3Hz-8Hz
- Rigidity
  - cogwheel
- Bradykinesia
  - slowing in movement
- Postural instability
  - poor balance

## Conventional Diagnosis of Parkinson's Disease

- Diagnosis of idiopathic Parkinson's Disease
  - based on clinical features
  - often very subjective
  - poor sensitivity - up to 25% error in diagnosis
  - PET scans to detect decreased dopamine activity
- Medication
  - L-dopa, artificial dopamine
  - has limited life due to feedback inhibition
  - eventually becomes counterproductive.

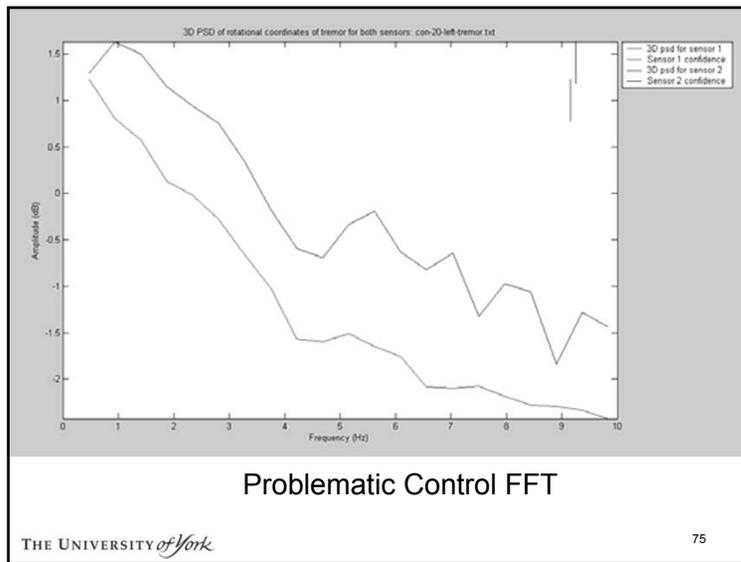

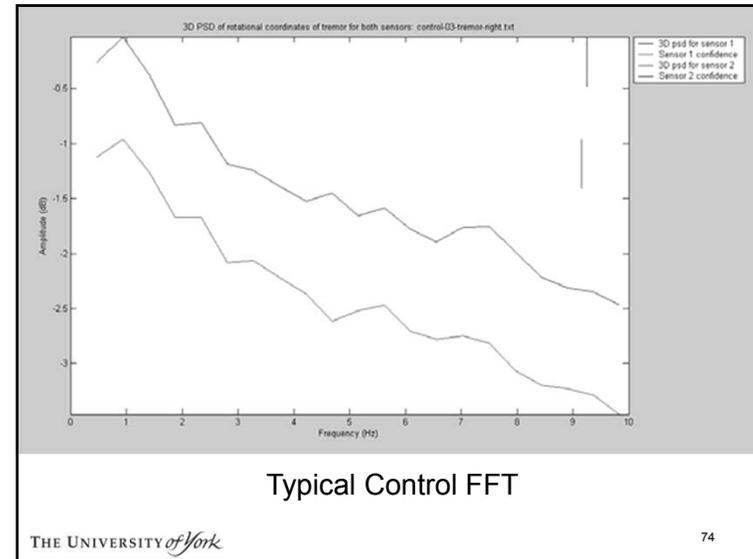

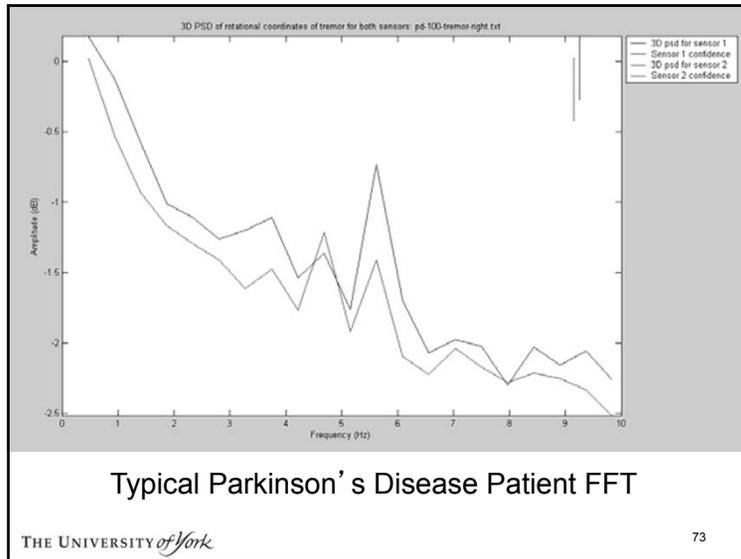

## Computer-Based Assessment

- Based on neuropsychological tasks
  - figure copying tasks
  - finger tapping tasks
  - measurement of tremor at rest
- Patient's movements digitised in real-time

## Data Analysis

- Initially, results poor
- Closer inspection of patient data
  - patients with Parkinson's disease
  - controls with no known neurodegenerative condition

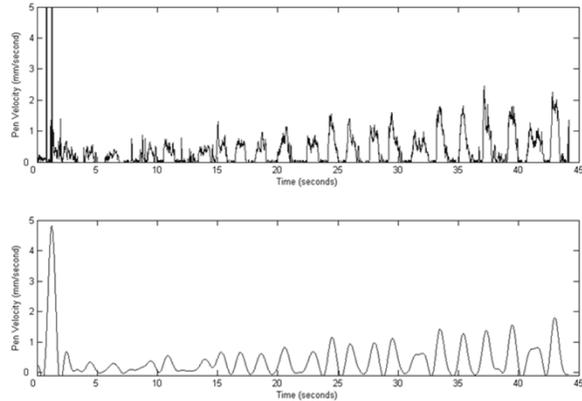

## Figure-Copying Tasks

- Choice of task domain important
- Used to emphasize symptoms under consideration

THE UNIVERSITY of York

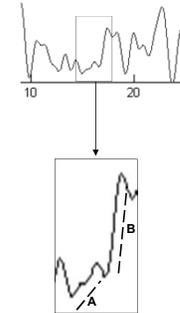

76

## Velocity Profile of Patient's Response

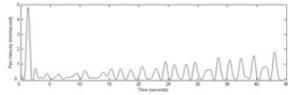

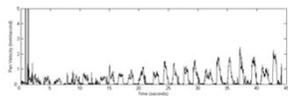

## Identification of Artefacts

- Artefacts unique to Parkinson's patients
  - determined through visual inspection
- Indicates a two-stage acceleration
- Consistent with hesitation
  - Bradykinesia?

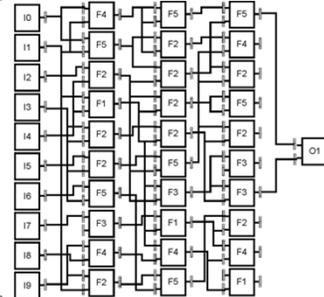

Patient Measurements

## Case Example 3: Thyroid cancer

- Incidence of 1 in 842 for men, 1 in 324 for women<sup>[1]</sup>
- 4 types, in order of increasing aggressiveness:
  - **Papillary carcinoma**
    - 70-80% of cases, low mortality rate
  - **Follicular carcinoma**
    - 10-15%, fairly low mortality rate
  - **Medullary carcinoma**
    - 5-10%, moderate mortality rate
  - **Anaplastic carcinoma**
    - <5%, high mortality rate

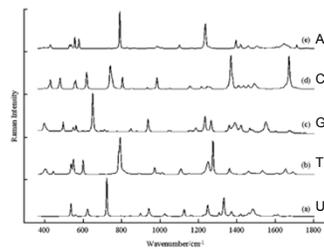

[1] UK Thyroid Cancer Statistics, Cancer Research UK, 2008.

## Raman spectroscopy

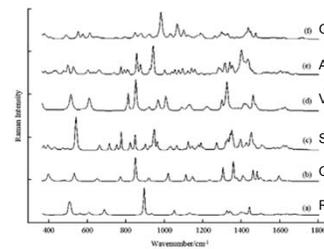

- Optical methodology
  - Uses monochromatic light
  - Measures energy states
- Advantages
  - Detailed
  - Fast
  - Non-invasive
  - Non-destructive
  - Uses small samples
- Disadvantages
  - Complex signals
  - Difficult to analyse

## Biochemical spectra

DNA and RNA bases

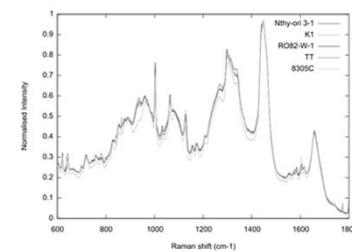

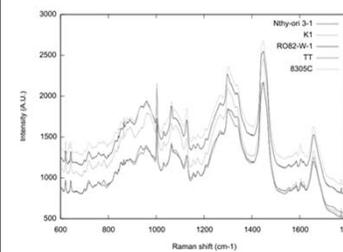

Amino acids

J. De Gelder, K. De Gussem, P. Vandenaebale and Luc Moens, Reference Database of Raman spectra of biological molecules, *Journal of Raman Spectroscopy* 38:1133-1147, 2007.

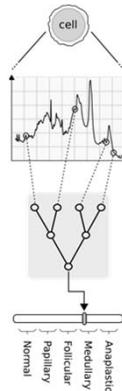

## Thyroid cell lines

Class	Name	Cell Type	Samples
1	Nthy-ori 3-1	Normal follicular epithelial	30
2	K1	Papillary thyroid carcinoma	25
3	RO82-W-1	Follicular thyroid carcinoma	25
4	TT	Medullary thyroid carcinoma	24
5	8305C	Anaplastic thyroid carcinoma	25

# Methodology

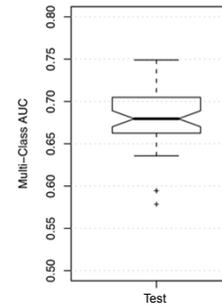

- Evolve classifiers
  - Terminal set: Raman offsets {600,...,1800}
  - Function set: +, -, \*, mean, min, max, negate
- Using implicit context representation CGP [Smith, 2005]
  - Cartesian Genetic Programming [Miller and Thomson, 2000]
  - Implicit context representation [Lones and Tyrrell, 2002]
- Fitness is the ability to separate cancer classes
  - In order of biological aggressiveness
  - Measured using multi-class area under ROC curve

S. Smith et al. An implicit context representation for evolving image processing filters, *Evo/ASP* 2005.  
 J. Miller and P. Thomson. Cartesian genetic programming, *EuroGP* 2000.  
 M. Lones and A. Tyrrell. *Genetic Programming and Evolvable Machines* 3(2):193-217.

Michael Lones et al. / Discriminating Normal and Cancerous Thyroid Cell Lines THE UNIVERSITY of York

## Experimental settings

- 50 runs, 50 generation limit, population of 500
- CGP grid size of 5x5
- Using training, validation and test sets

Function	Description
$x + y$	Returns the sum of its inputs
$x - y$	Returns the difference of its inputs
$x * y$	Returns the product of its inputs
$\{x,y\}$	Returns the mean of its inputs
$\min\{x,y\}$	Returns the lesser of its inputs
$\max\{x,y\}$	Returns the greater of its inputs
$-x$	Returns its input multiplied by -1

THE UNIVERSITY of York 95

## Planning your own study

- Determine the *real* clinical need
  - and the potential for commercialisation
- Identify clinical collaborators
- Design a clinical protocol
- Protect intellectual property
- Apply for ethical approval
- Obtain regulatory compliance
- Undertake clinical studies
- Processing data

## Determine the *Real* Clinical Need

- *Not* searching for a need for the technology you have developed
- Speak to the users
  - doctors, nurses and patients
- Try to evaluate:
  - improved quality of life
  - cost savings/other benefits

## Potential for Commercialisation

- Consider commercialisation at the outset
  - establish what is needed and will be useful
  - gets the technology to the patient
  - raises funding for development
    - and further research
- The process itself can have value

## Identifying Clinical Collaborators

- Essential for:
  - data
  - establishing the justification of the work
  - obtaining sufficient patient numbers
  - obtaining clinical acceptance
  - provide clinical interpretation of results

## Designing a Clinical Protocol

- Should be clinically led
  - beware of mission creep/other clinical interests
  - needs to establish ground truth through conventional clinical tests
  - consider engaging a clinical trial unit
- Principal and secondary research questions
- Participant sample size
  - with statistical justification
- Inclusion/exclusion criteria
- End points

## Datasets

- If using existing data determine its:
  - suitability
  - integrity
- If no existing datasets available
  - need to acquire patient measurement
  - ethical approval required
  - sensors may also require regulatory approval

## Applying for Ethical Approval

- Scientific justification
- Clinical protocol
- Participant recruitment procedures
  - participant information sheet
  - informed consent
- Research may need to undergo external review

## Protect Intellectual Property

- Not as difficult as it sounds
  - initial filing
  - PCT
  - International Phase
- Engage a good patent attorney
- Essential for getting attention
  - and securing further funding

## Regulatory Compliance

- Consider then need for regulatory compliance
- Sometimes required to undertake clinical studies
  - required before sales can begin
  - often based on self-certification
- Different regulatory bodies for different countries
  - all based on same ISO standards

## Undertake Preliminary Clinical Studies

- Small proof of concept study
  - validates the technology
  - helps determine the clinical need
  - highlights problems/modifications
  - gains supporters/champions

## Analysing Data

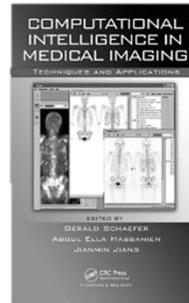

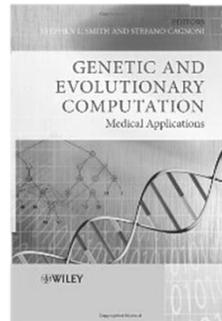

- Choose an appropriate algorithm
- Consider adopting clinically accepted measures
- Use k-fold cross-validation when dealing with small patient numbers
- Ensembles can be effective in increasing classification performance

## Avoid Common Pitfalls

- Don't touch the patients (or their data!)
  - until you have the necessary ethical approval/consent
  - and possibly other statutory authority
- Be careful what you offer
  - work takes time and consultants can be demanding!
- Expect to do all the running
  - medics are busy
  - many not be used to applying for grants
  - or writing long papers

## Useful Resources

- Books

## Useful Resources

- Journals

- IEEE Transactions on Evolutionary Computation
- Genetic Programming and Evolvable Machines
- IEEE Transactions on Neural Systems and Rehabilitation Engineering
- BioSystems
- International Journal of Computers in Healthcare

## Useful Resources

- Conferences

- IEEE Symposium Series on Computational Intelligence (SSCI) Workshop on Computational Intelligence in Medical Imaging (CIMI)
- Genetic and Evolutionary Computation Conference (GECCO) Medical Applications of Genetic and Evolutionary Computation (MedGEC)

## Possible Benefits

- More publications
  - in engineering and medical journals
- More funding sources
  - government grants
  - basic & applied research and knowledge transfer
  - charities
  - patents and spin-out companies!
- More fun!

## Summary

- Medical applications of EC rely on:
  - good collaborations
  - good data
  - appropriate evolutionary algorithms
