Overview

- 1 Introduction
- 2 Deciding the State Complexity of $D(L)$
- 3 Deciding the Form of the Hierarchy of $D^i(L)$
- 4 Conclusion

Distinguishability Sets

distinguish between states of a DFA:

for states p, q , find a word w such that $\delta(p, w) \in F \iff \delta(q, w) \notin F$.

distinguish between words:

for words x, y find a word w such that $xw \in L \iff yw \notin L$.

Distinguishability Sets

distinguish between states of a DFA:

for states p, q , find a word w such that $\delta(p, w) \in F \iff \delta(q, w) \notin F$.

distinguish between words:

for words x, y find a word w such that $xw \in L \iff yw \notin L$.

[Câmpeanu, Moreira, Reis, 2014] study distinguishability sets

... for a DFA $A = (Q, \Sigma, \delta, q_0, F)$:

$$D_A(p, q) = \{ w \in \Sigma^* \mid \delta(p, w) \in F \iff \delta(q, w) \notin F \}, \quad D(A) = \bigcup_{p, q \in Q} D_A(p, q)$$

... and for a language $L \subseteq \Sigma^*$:

$$D_L(x, y) = \{ w \in \Sigma^* \mid xw \in L \iff yw \notin L \}, \quad D(L) = \bigcup_{x, y \in \Sigma^*} D_L(x, y)$$

Distinguishability Sets

distinguish between states of a DFA:

for states p, q , find a word w such that $\delta(p, w) \in F \iff \delta(q, w) \notin F$.

distinguish between words:

for words x, y find a word w such that $xw \in L \iff yw \notin L$.

[Câmpeanu, Moreira, Reis, 2014] study distinguishability sets

... for a DFA $A = (Q, \Sigma, \delta, q_0, F)$:

$$D_A(p, q) = \{ w \in \Sigma^* \mid \delta(p, w) \in F \iff \delta(q, w) \notin F \}, \quad D(A) = \bigcup_{p, q \in Q} D_A(p, q)$$

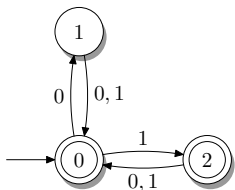

... and for a language $L \subseteq \Sigma^*$:

$$D_L(x, y) = \{ w \in \Sigma^* \mid xw \in L \iff yw \notin L \}, \quad D(L) = \bigcup_{x, y \in \Sigma^*} D_L(x, y)$$

If all states in A are reachable and $L = L(A)$ then $D(L) = D(A)$.

An Example (from [CMR14])

A :

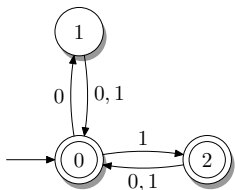

$$L(A) = (\{0, 1\}^2)^* \cup \{0, 1\}^* \{1\}$$

$$D_A(1, 0) = \{\lambda\} \cup \{0, 1\}(\{0, 1\}^2)^* \{0\} \\ \cup (\{0, 1\}^2)^* \{0\}$$

An Example (from [CMR14])

A:

$$L(A) = (\{0, 1\}^2)^* \cup \{0, 1\}^* \{1\}$$

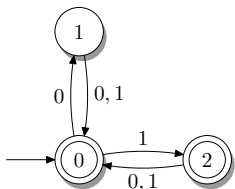

$$D_A(1, 0) = \{\lambda\} \cup \{0, 1\}(\{0, 1\}^2)^* \{0\} \\ \cup (\{0, 1\}^2)^* \{0\}$$

$$D_A(1, 2) = \{\lambda\}$$

$$D_A(0, 2) = D_A(1, 0) \setminus \{\lambda\}$$

An Example (from [CMR14])

A:

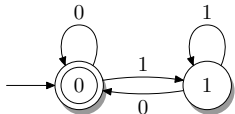

$$L(A) = (\{0, 1\}^2)^* \cup \{0, 1\}^* \{1\}$$

$$D_A(1, 0) = \{\lambda\} \cup \{0, 1\}(\{0, 1\}^2)^* \{0\} \\ \cup (\{0, 1\}^2)^* \{0\}$$

$$D_A(1, 2) = \{\lambda\}$$

$$D_A(0, 2) = D_A(1, 0) \setminus \{\lambda\}$$

D(A):

$$D(A) = \{\lambda\} \cup \{0, 1\}^* \{0\}$$

$$D_L(x, y) = \{w \in \Sigma^* \mid xw \in L \Leftrightarrow yw \notin L\}, \quad D(L) = \bigcup_{x, y \in \Sigma^*} D_L(x, y)$$

Alternative characterization of $D(L)$:

$$D(L) = \text{suff}(L) \cap \text{suff}(\overline{L}),$$

where $\text{suff}(L) = \{v \in \Sigma^* \mid uv \in L \text{ for some } u \in \Sigma^*\}$ are the suffixes of words from L and $\overline{L} = \Sigma^* \setminus L$ is the complement of L .

$$D_L(x, y) = \{w \in \Sigma^* \mid xw \in L \Leftrightarrow yw \notin L\}, \quad D(L) = \bigcup_{x, y \in \Sigma^*} D_L(x, y)$$

Alternative characterization of $D(L)$:

$$D(L) = \text{suff}(L) \cap \text{suff}(\overline{L}),$$

where $\text{suff}(L) = \{v \in \Sigma^* \mid uv \in L \text{ for some } u \in \Sigma^*\}$ are the suffixes of words from L and $\overline{L} = \Sigma^* \setminus L$ is the complement of L .

- $D(L)$ is suffix-closed.
 - If L is regular then $D(L)$ is regular.
- The worst case state complexity of $D(L)$ is $2^n - n$

$$D_L(x, y) = \{w \in \Sigma^* \mid xw \in L \Leftrightarrow yw \notin L\}, \quad D(L) = \bigcup_{x, y \in \Sigma^*} D_L(x, y)$$

Alternative characterization of $D(L)$:

$$D(L) = \text{suff}(L) \cap \text{suff}(\overline{L}),$$

where $\text{suff}(L) = \{v \in \Sigma^* \mid uv \in L \text{ for some } u \in \Sigma^*\}$ are the suffixes of words from L and $\overline{L} = \Sigma^* \setminus L$ is the complement of L .

- $D(L)$ is suffix-closed.
- If L is regular then $D(L)$ is regular.
The worst case state complexity of $D(L)$ is $2^n - n$

Problem: D-SET-SIZE

Given a DFA A and an integer k , decide whether $\text{sc}(D(L(A))) \leq k$.

Overview

- 1 Introduction
- 2 Deciding the State Complexity of $D(L)$**
- 3 Deciding the Form of the Hierarchy of $D^i(L)$
- 4 Conclusion

Deciding the State Complexity of $D(L)$

Problem: D-SET-SIZE

Given a DFA A and an integer k , decide whether $\text{sc}(D(L(A))) \leq k$.

Lemma

D-SET-SIZE is contained in PSPACE.

Deciding $\text{sc}(L(B)) \leq k$ for a DFA B is NL-complete.

Given an n -state DFA A , a DFA A_D for $D(L(A))$ can be constructed with at most $2^n - n$ states. [CMR14]

Construct A_D on-the-fly and use the NL-algorithm on it.

Construct A_D on-the-fly and use the NL-algorithm on it.

Lemma

D-SET-SIZE is PSPACE-hard.

D-SET-SIZE is PSPACE-hard

Reduction from the PSPACE-complete problem

Problem: DFA-UNION-UNIVERSALITY

Given DFAs A_1, A_2, \dots, A_n with common input alphabet Σ , decide whether $\bigcup_{i=1}^n L(A_i) = \Sigma^*$.

D-SET-SIZE is PSPACE-hard

Reduction from the PSPACE-complete problem

Problem: DFA-UNION-UNIVERSALITY

Given DFAs A_1, A_2, \dots, A_n with common input alphabet Σ , decide whether $\bigcup_{i=1}^n L(A_i) = \Sigma^*$.

- We may assume $\{\lambda\} \cup \Sigma \subseteq \bigcup_{i=1}^n L(A_i)$ and add DFAs
 A_{n+1} for language $\{\lambda\}$
 A_{n+2} for language Σ
- Minimize DFAs A_1, A_2, \dots, A_{n+2} and (polynomial time reduction)
- add reset symbol $\#$ that takes A_i back to its initial state.

Obtain $A'_1, A'_2, \dots, A'_{n+2}$ with $A'_i = (Q'_i, \Sigma_{\#}, \delta'_i, s'_i, F'_i)$, $\Sigma_{\#} = \Sigma \cup \{\#\}$

$$\bigcup_{i=1}^n L(A_i) = \Sigma^* \iff \bigcup_{i=1}^{n+2} L(A'_i) = \Sigma_{\#}^*$$

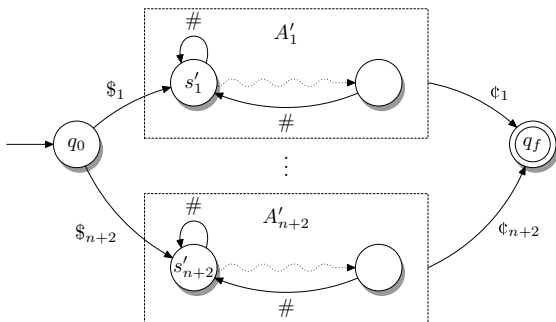

D-SET-SIZE is PSPACE-hard (2)

Combine the DFAs $A'_i = (Q'_i, \Sigma_\#, \delta'_i, s'_i, F'_i)$, $1 \leq i \leq n+2$, to one DFA $A = (Q, \Gamma, \delta, q_0, F)$:

$$\Gamma = \Sigma_\# \cup \{ \$_i, \pounds_i \mid 1 \leq i \leq n+2 \}$$

$$Q = \bigcup_{i=1}^{n+2} Q'_i \cup \{q_0, q_f, q_s\},$$

$$F = \bigcup_{i=1}^{n+2} F'_i \cup \{q_f\},$$

D-SET-SIZE is PSPACE-hard (2)

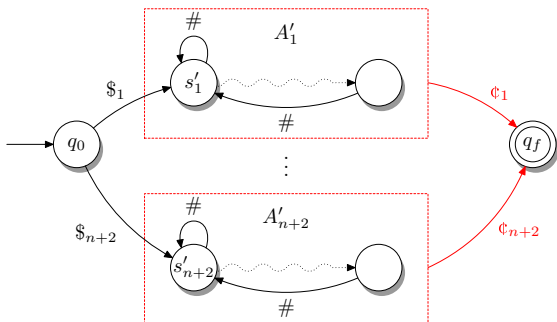

Combine the DFAs $A'_i = (Q'_i, \Sigma_{\#}, \delta'_i, s'_i, F'_i)$, $1 \leq i \leq n + 2$, to one DFA $A = (Q, \Gamma, \delta, q_0, F)$:

$$\Gamma = \Sigma_{\#} \cup \{ \$_i, \#_i \mid 1 \leq i \leq n + 2 \}$$

$$Q = \bigcup_{i=1}^{n+2} Q'_i \cup \{q_0, q_f, q_s\},$$

$$F = \bigcup_{i=1}^{n+2} F'_i \cup \{q_f\},$$

for all $q_i \in Q'_i$:
 $\delta(q_i, \#_i) = q_f$

D-SET-SIZE is PSPACE-hard (2)

Combine the DFAs $A'_i = (Q'_i, \Sigma_{\#}, \delta'_i, s'_i, F'_i)$, $1 \leq i \leq n + 2$, to one DFA $A = (Q, \Gamma, \delta, q_0, F)$:

$$\Gamma = \Sigma_{\#} \cup \{ \$_i, \#_i \mid 1 \leq i \leq n + 2 \}$$

$$Q = \bigcup_{i=1}^{n+2} Q'_i \cup \{q_0, q_f, q_s\},$$

$$F = \bigcup_{i=1}^{n+2} F'_i \cup \{q_f\},$$

for all $q_i \in Q'_i$:
 $\delta(q_i, \#_i) = q_f$

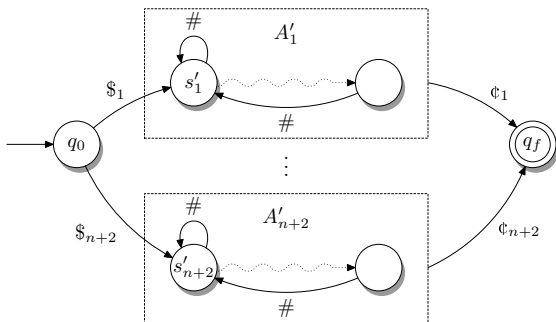

target number of
states: $k = |Q| + 1$

Claim:

$$\text{sc}(D(L(A))) \leq k$$

if and only if

$$\bigcup_{i=1}^{n+2} L(A'_i) = \Sigma_{\#}^*$$

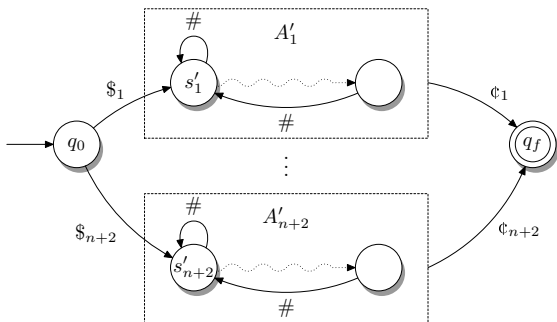

D-SET-SIZE is PSPACE-hard (3)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i \subseteq \mathbf{D}(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i.$$

Let $w \in \mathbf{D}(L)$, then $\delta(q, w) \in F$ for some $q \in Q$

- if $q = q_0$: $w \in L$

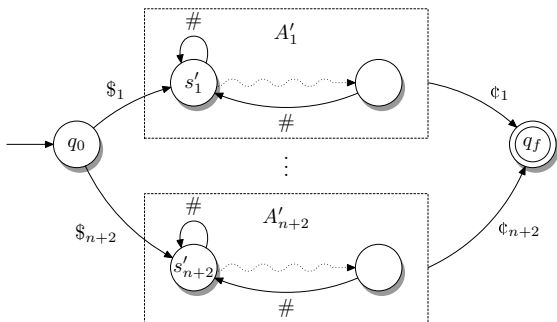

D-SET-SIZE is PSPACE-hard (3)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i \subseteq \mathbf{D}(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i.$$

Let $w \in \mathbf{D}(L)$, then $\delta(q, w) \in F$ for some $q \in Q$

- if $q = q_0$: $w \in L$
- if $q = q_f$: $w = \lambda \in \Sigma_{\#}^*$

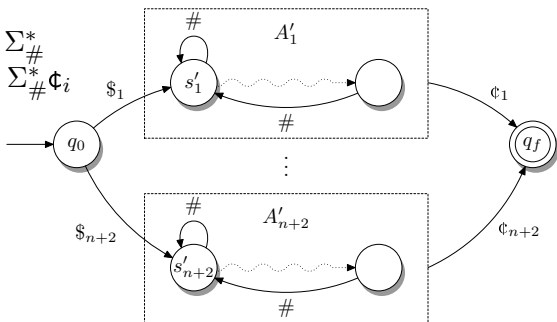

D-SET-SIZE is PSPACE-hard (3)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \mathfrak{C}_i \subseteq \mathbf{D}(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \mathfrak{C}_i.$$

Let $w \in \mathbf{D}(L)$, then $\delta(q, w) \in F$ for some $q \in Q$

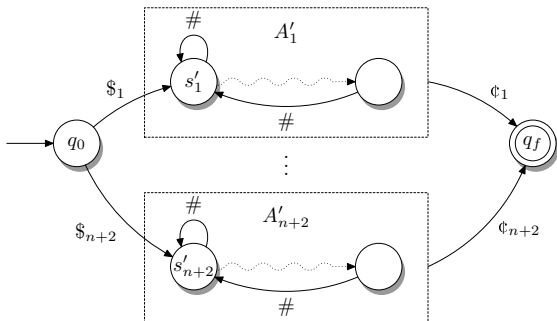

- if $q = q_0$: $w \in L$
- if $q = q_f$: $w = \lambda \in \Sigma_{\#}^*$
- if $q \in Q_i$:
 - ▶ if $\delta(q, w) \in F_i$: $w \in \Sigma_{\#}^*$
 - ▶ if $\delta(q, w) = q_f$: $w \in \Sigma_{\#}^* \mathfrak{C}_i$

D-SET-SIZE is PSPACE-hard (3)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i \subseteq D(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i.$$

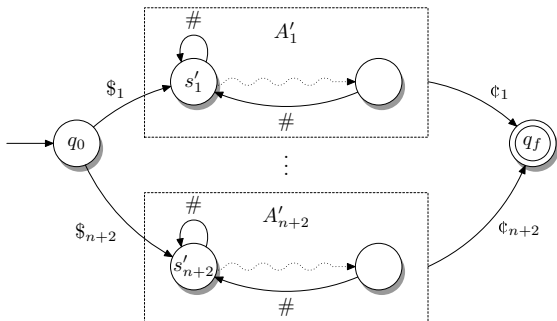

- $L \subseteq D(L)$:
 A has a sink state.

D-SET-SIZE is PSPACE-hard (3)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \# \subseteq D(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \# .$$

- $L \subseteq D(L)$:
 A has a sink state.
- $\bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \# \subseteq D(L)$:
 $\bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \# \subseteq L \subseteq D(L)$,
 and $D(L)$ is suffix-closed.

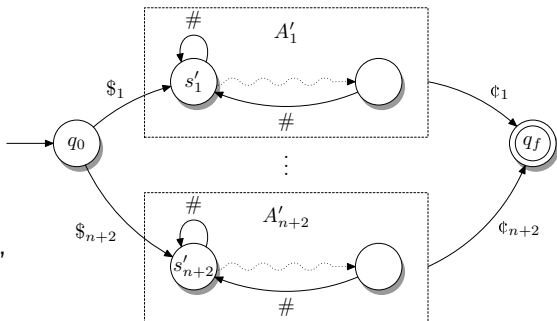

D-SET-SIZE is PSPACE-hard (3)

$$\Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \mathfrak{C}_i \subseteq D(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \mathfrak{C}_i.$$

- $L \subseteq D(L)$:
 A has a sink state.
- $\bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \mathfrak{C}_i \subseteq D(L)$:
 $\bigcup_{i=1}^{n+2} \mathfrak{S}_i \Sigma_{\#}^* \# \mathfrak{C}_i \subseteq L \subseteq D(L)$,
 and $D(L)$ is suffix-closed.

If $\bigcup_{i=1}^{n+2} L(A'_i) = \Sigma_{\#}^*$:

- $\Sigma_{\#}^* \subseteq D(L)$:
 $\bigcup_{i=1}^{n+2} \mathfrak{S}_i L(A'_i) \subseteq L \subseteq D(L)$,
 and $D(L)$ is suffix-closed.

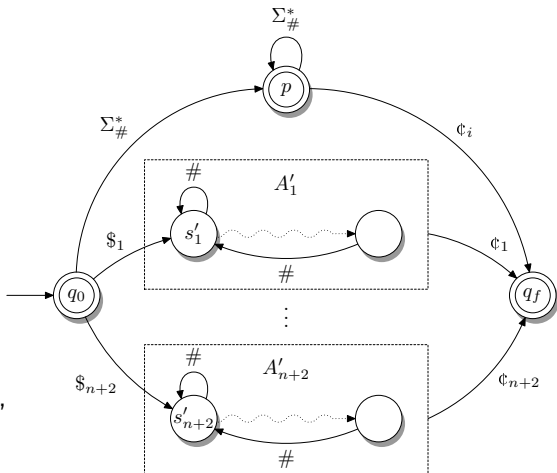

D-SET-SIZE is PSPACE-hard (3)

$$\Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \zeta_i \subseteq D(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \zeta_i.$$

- $L \subseteq D(L)$:
 A has a sink state.
- $\bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# \zeta_i \subseteq D(L)$:
 $\bigcup_{i=1}^{n+2} \$_i \Sigma_{\#}^* \# \zeta_i \subseteq L \subseteq D(L)$,
 and $D(L)$ is suffix-closed.

If $\bigcup_{i=1}^{n+2} L(A'_i) = \Sigma_{\#}^*$:

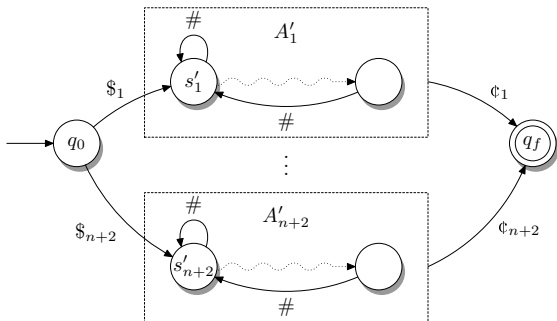

- $\Sigma_{\#}^* \subseteq D(L)$:
 $\bigcup_{i=1}^{n+2} \$_i L(A'_i) \subseteq L \subseteq D(L)$,
 and $D(L)$ is suffix-closed.

D-SET-SIZE is PSPACE-hard (4)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# c_i \subseteq D(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# c_i.$$

Let $w \in \Sigma_{\#}^*$ with $w \notin \bigcup_{i=1}^{n+2} L(A'_i)$ and B be a DFA with $L(B) = D(L)$.

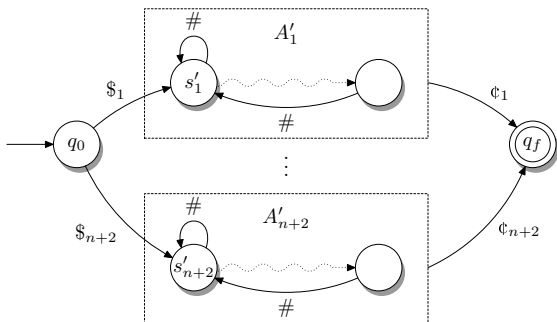

D-SET-SIZE is PSPACE-hard (4)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i \subseteq D(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i.$$

Let $w \in \Sigma_{\#}^*$ with $w \notin \bigcup_{i=1}^{n+2} L(A'_i)$ and B be a DFA with $L(B) = D(L)$.

Because $\$i^{-1}D(L) = \$i^{-1}L$ and all A'_i are minimal, B “contains” A .

$$L(A'_{n+1}) = \{\lambda\}, L(A'_{n+2}) = \Sigma \implies \Sigma \subseteq D(L)$$

D-SET-SIZE is PSPACE-hard (4)

$$L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i \subseteq D(L) \subseteq \Sigma_{\#}^* \cup L \cup \bigcup_{i=1}^{n+2} \Sigma_{\#}^* \# i.$$

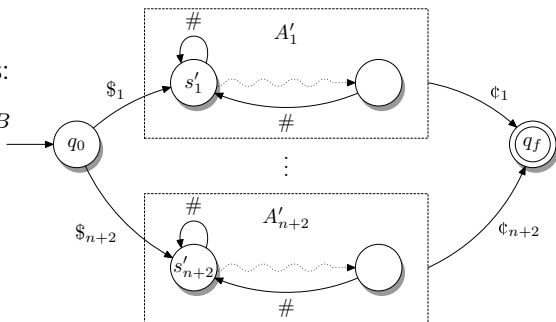

Let $w \in \Sigma_{\#}^*$ with $w \notin \bigcup_{i=1}^{n+2} L(A'_i)$ and B be a DFA with $L(B) = D(L)$.

Because $\$i^{-1}D(L) = \$i^{-1}L$ and all A'_i are minimal, B “contains” A .

$$L(A'_{n+1}) = \{\lambda\}, L(A'_{n+2}) = \Sigma \implies \Sigma \subseteq D(L)$$

One can show that B needs at least two additional states:

- $p_1 = \delta_B(q_{0,B}, \#w) \notin F_B$
- $p_2 = \delta_B(q_{0,B}, a) \in F_B$ for some $a \in \Sigma$.

D-SET-SIZE is PSPACE-complete

Theorem

D-SET-SIZE is PSPACE-complete.

Remark

Also logspace-reduction is possible:

Instead of minimizing the input DFAs A_i in the union universality instance, use additional symbols to ensure their minimality.

Recognizing Representations of $D(L)$

Problem: L-VERSUS-D

Given two DFAs A and B with $L = L(A)$ and $L' = L(B)$, is $L' = D(L)$?

Theorem

L -VERSUS-D is PSPACE-complete.

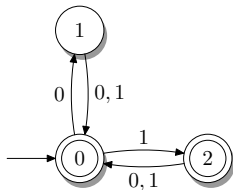

Remark

Deciding $L' \supseteq D(L)$ is NL-complete and $L' \subseteq D(L)$ is PSPACE-complete.

- 1 Introduction
- 2 Deciding the State Complexity of $D(L)$
- 3 Deciding the Form of the Hierarchy of $D^i(L)$
- 4 Conclusion

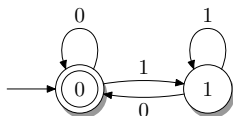

An Example (from [CMR14])

L :

$$L = (\{0, 1\}^2)^* \cup \{0, 1\}^* \{1\}$$

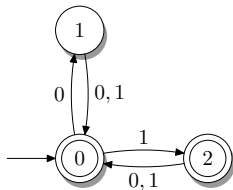

$D(L)$:

$$D(L) = \{\lambda\} \cup \{0, 1\}^* \{0\}$$

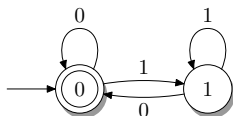

An Example (from [CMR14])

L :

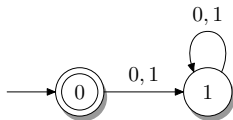

$$L = (\{0, 1\}^2)^* \cup \{0, 1\}^* \{1\}$$

$D(L)$:

$$D(L) = \{\lambda\} \cup \{0, 1\}^* \{0\}$$

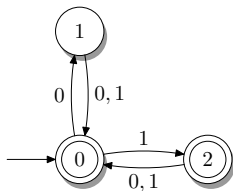

$D^2(L)$:

$$D^2(L) = D(D(L)) = \{\lambda\}$$

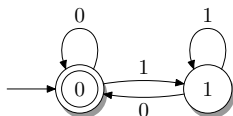

An Example (from [CMR14])

L :

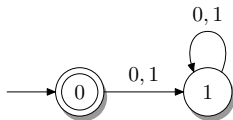

$$L = (\{0, 1\}^2)^* \cup \{0, 1\}^* \{1\}$$

$D(L)$:

$$D(L) = \{\lambda\} \cup \{0, 1\}^* \{0\}$$

$D^2(L)$:

$$D^2(L) = D(D(L)) = \{\lambda\}$$

$D^3(L)$:

$$D^2(L) = D^3(L) = \dots = \{\lambda\}$$

The Hierarchy $L, D(L), D^2(L), \dots$

We know from [Câmpeanu, Moreira, Reis, 2014]:

$$D(L) \supseteq D^2(L) = D^{2+i}(L) \text{ for } i \geq 0,$$

- and
- $L \supseteq D(L)$ if L suffix-closed
 - $L \subseteq D(L)$ if L has \emptyset as a quotient

Interestingly, these are only *sufficient* conditions ($((a^n)^* \subseteq D((a^n)^*))$), but:

$L = D(L)$ if and only if L is suffix closed and has \emptyset as a quotient.

The Hierarchy $L, D(L), D^2(L), \dots$

We know from [Câmpeanu, Moreira, Reis, 2014]:

$$D(L) \supseteq D^2(L) = D^{2+i}(L) \text{ for } i \geq 0,$$

- and
- $L \supseteq D(L)$ if L suffix-closed
 - $L \subseteq D(L)$ if L has \emptyset as a quotient

Interestingly, these are only *sufficient* conditions ($((a^n)^* \subseteq D((a^n)^*))$), but:

$L = D(L)$ if and only if L is suffix closed and has \emptyset as a quotient.

Decision Problems on the Hierarchy

Given a DFA A with $L = L(A)$,

- | | |
|----------------------|------------------|
| is $L = D(L)$? | L-EQUALS-D |
| is $D(L) = D^2(L)$? | D-EQUALS-DSQUARE |
| is $L = D^2(L)$? | L-EQUALS-DSQUARE |

L-EQUALS-D is NL-complete

Theorem

L-EQUALS-D is NL-complete.

$L = D(L)$ if and only if L is suffix closed and has \emptyset as a quotient. [CMR14]

Both properties can be checked in NL \implies containment in NL follows.

NL-hardness by a reduction from the graph reachability problem.

D-EQUALS-DSQUARE and Synchronization

A (not necessarily regular) language $L \subseteq \Sigma$ is *language-synchronizing* if there exists a *language-reset word* $w \in \Sigma^*$ such that

for all $x, y, z \in \Sigma^*$: $xwz \in L$ if and only if $ywz \in L$.

Theorem

A language $L \subseteq \Sigma^*$ is language-synchronizing if and only if $D(L) = D^2(L)$.

D-EQUALS-DSQUARE and Synchronization

A (not necessarily regular) language $L \subseteq \Sigma$ is *language-synchronizing* if there exists a *language-reset word* $w \in \Sigma^*$ such that

for all $x, y, z \in \Sigma^*$: $xwz \in L$ if and only if $ywz \in L$.

Theorem

A language $L \subseteq \Sigma^*$ is language-synchronizing if and only if $D(L) = D^2(L)$.

L is language-synchronizing with language-reset word w if and only if:

for all $x, y, z \in \Sigma^*$: $wz \in x^{-1}L$ if and only if $wz \in y^{-1}L$

for all $z \in \Sigma^*$: $wz \notin D(L)$

$$w^{-1}D(L) = \emptyset$$

D-EQUALS-DSQUARE and Synchronization

A (not necessarily regular) language $L \subseteq \Sigma$ is *language-synchronizing* if there exists a *language-reset word* $w \in \Sigma^*$ such that

for all $x, y, z \in \Sigma^*$: $xwz \in L$ if and only if $ywz \in L$.

Theorem

A language $L \subseteq \Sigma^*$ is language-synchronizing if and only if $D(L) = D^2(L)$.

L is language-synchronizing with language-reset word w if and only if:

for all $x, y, z \in \Sigma^*$: $wz \in x^{-1}L$ if and only if $wz \in y^{-1}L$

for all $z \in \Sigma^*$: $wz \notin D(L)$

$$w^{-1}D(L) = \emptyset$$

$D(L) = D^2(L)$ if and only if $D(L)$ has \emptyset as a quotient.

[CMR14]

D-EQUALS-DSQUARE is NL-complete

A DFA $A = (Q, \Sigma, \delta, q_0, F)$ is *synchronizing* if there exists $w \in \Sigma^*$, $q \in Q$ such that $\delta(p, w) = q$ for all $p \in Q$.

Theorem

A regular language $L \subseteq \Sigma^$ is language-synchronizing if and only if the minimal DFA for L is synchronizing.*

D-EQUALS-DSQUARE is NL-complete

A DFA $A = (Q, \Sigma, \delta, q_0, F)$ is *synchronizing* if there exists $w \in \Sigma^*$, $q \in Q$ such that $\delta(p, w) = q$ for all $p \in Q$.

Theorem

A regular language $L \subseteq \Sigma^$ is language-synchronizing if and only if the minimal DFA for L is synchronizing.*

Theorem

Deciding for a given DFA A , whether it is synchronizing, is NL-complete (even if the problem instances are restricted to minimal DFAs).

D-EQUALS-DSQUARE is NL-complete

A DFA $A = (Q, \Sigma, \delta, q_0, F)$ is *synchronizing* if there exists $w \in \Sigma^*$, $q \in Q$ such that $\delta(p, w) = q$ for all $p \in Q$.

Theorem

A regular language $L \subseteq \Sigma^$ is language-synchronizing if and only if the minimal DFA for L is synchronizing.*

Theorem

Deciding for a given DFA A , whether it is synchronizing, is NL-complete (even if the problem instances are restricted to minimal DFAs).

Theorem

D-EQUALS-DSQUARE is NL-complete.

L-EQUALS-DSQUARE is NL-complete

Theorem

L-EQUALS-DSQUARE *is* NL-complete.

Observe that $L = D^2(L)$ if and only if $L = D(L)$:

L-EQUALS-DSQUARE is NL-complete

Theorem

L-EQUALS-DSQUARE *is* NL-complete.

Observe that $L = D^2(L)$ if and only if $L = D(L)$:

Assume $L = D^2(L)$, apply $D \implies D(L) = D^3(L)$

Because $D^2(L) = D^3(L)$, we obtain $D(L) = D^2(L) = L$.

L-EQUALS-DSQUARE is NL-complete

Theorem

L-EQUALS-DSQUARE is NL-complete.

Observe that $L = D^2(L)$ if and only if $L = D(L)$:

Assume $L = D^2(L)$, apply $D \implies D(L) = D^3(L)$

Because $D^2(L) = D^3(L)$, we obtain $D(L) = D^2(L) = L$.

Conversely assume $L = D(L)$, apply $D \implies D(L) = D^2(L)$

We obtain $L = D(L) = D^2(L)$.

Overview

- 1 Introduction
- 2 Deciding the State Complexity of $D(L)$
- 3 Deciding the Form of the Hierarchy of $D^i(L)$
- 4 Conclusion

Conclusion

Summary

- PSPACE-complete decision problems even for DFAs:
 - ▶ D-SET-SIZE
 - ▶ L-VERSUS-D
- NL-complete decision problems on the hierarchy of $D^i(L)$
 - ▶ link to synchronizing DFAs

Further Research

- Use prefixes or infixes instead of suffixes:
 $\text{suff}(L) \cap \text{suff}(\bar{L}), \quad \text{pref}(L) \cap \text{pref}(\bar{L}), \quad \text{infix}(L) \cap \text{infix}(\bar{L})$
- Use quasi-lexicographically minimal distinguishing words: [CMR14]
 $\underline{D}_L(x, y) = \min\{w \mid w \in D_L(x, y)\}, \quad \underline{D}(L) = \{\underline{D}_L(x, y) \mid x \neq_L y\}$
The $\underline{D}^i(L)$ -hierarchy is finite for every L , but fixed point may vary.

Thank you for your attention!
